- The instruction executes without writeback of the base address.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

T1

T1 variant

```
STRBT{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

Decode for this encoding

```
if Rn == '1111' then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);  postindex = FALSE;  add = TRUE;
register_form = FALSE;  imm32 = ZeroExtend(imm8, 32);
if t == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

CONSTRAINED UNPREDICTABLE behavior

If `t == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<Rt>` For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated.

For encoding A2 and T1: is the general-purpose register to be transferred, encoded in the "Rt" field.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

`+/-` For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`<Rm>` Is the general-purpose index register, encoded in the "Rm" field.

`<shift>` The shift to apply to the value read from `<Rm>`. If absent, no shift is applied. Otherwise, see *Shifts applied to a register* on page F2-3663.

`+` Specifies the offset is added to the base register.

`<imm>` For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.

For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

Operation for all encodings

```
if ConditionPassed() then
    if PSTATE.EL == EL2 then UNPREDICTABLE;               // Hyp mode
    EncodingSpecificOperations();
    offset = if register_form then Shift(R[m], shift_t, shift_n, PSTATE.C) else imm32;
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if postindex then R[n] else offset_addr;
    MemU_unpriv[address,1] = R[t]<7:0>;
    if postindex then R[n] = offset_addr;
```

F5.1.233 STRD (immediate)

Store Register Dual (immediate) calculates an address from a base register value and an immediate offset, and stores two words from two registers to memory. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see *Memory accesses* on page F2-3665.

A1

Offset variant

Applies when `P == 1 && W == 0`.

```
STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn> {, #{+/-}<imm>}]
```

Post-indexed variant

Applies when `P == 0 && W == 0`.

```
STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>], #{+/-}<imm>
```

Pre-indexed variant

Applies when `P == 1 && W == 1`.

```
STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>, #{+/-}<imm>]!
```

Decode for all variants of this encoding

```
if Rt<0> == '1' then UNPREDICTABLE;
t = UInt(Rt);  t2 = t+1;  n = UInt(Rn);  imm32 = ZeroExtend(imm4H:imm4L, 32);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
if P == '0' && W == '1' then UNPREDICTABLE;
if wback && (n == 15 || n == t || n == t2) then UNPREDICTABLE;
if t2 == 15 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `t == 15 || t2 == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

If `wback && (n == t || n == t2)`, then one of the following behaviors must occur:

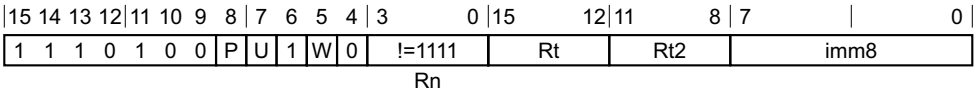
- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The store instruction executes but the value stored is UNKNOWN.

If `wback && n == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction executes without writeback of the base address.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

- The instruction uses the addressing mode described in the equivalent immediate offset instruction.



If `Rt<0> == '1'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction executes with the additional decode: t<0> = '0'.
- The instruction executes with the additional decode: t2 = t.
- The instruction executes as described, with no change to its behavior and no additional side-effects. This does not apply when Rt == '1111'.

If `P == '0' && W == '1'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction executes as an `LDRD` using one of offset, post-indexed, or pre-indexed addressing.

T1

Offset variant

Applies when `P == 1 && W == 0`.

```
STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn> {, #{+/-}<imm>}]
```

Post-indexed variant

Applies when `P == 0 && W == 1`.

```
STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>], #{+/-}<imm>
```

Pre-indexed variant

Applies when `P == 1 && W == 1`.

```
STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>, #{+/-}<imm>]!
```

Decode for all variants of this encoding

```
if P == '0' && W == '0' then SEE "Related encodings";
t = UInt(Rt);  t2 = UInt(Rt2);  n = UInt(Rn);  imm32 = ZeroExtend(imm8:'00', 32);
index = (P == '1');  add = (U == '1');  wback = (W == '1');
if wback && (n == t || n == t2) then UNPREDICTABLE;
if n == 15 || t == 15 || t2 == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If `t == 15 || t2 == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

If `wback && (n == t || n == t2)`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The store instruction executes but the value stored is UNKNOWN.

If `wback && n == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction executes without writeback of the base address.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Related encodings: *Load/store dual, load/store exclusive, load-acquire/store-release, and table branch* on page F3-3726.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<Rt>` For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. This register must be even-numbered and not R14.

For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.

`<Rt2>` For encoding A1: is the second general-purpose register to be transferred. This register must be `<R(t+1)>`.

For encoding T1: is the second general-purpose register to be transferred, encoded in the "Rt2" field.

`<Rn>` For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated.

For encoding T1: is the general-purpose base register, encoded in the "Rn" field.

`+/-` Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`<imm>` For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is the unsigned immediate byte offset, a multiple of 4, in the range 0 to 1020, defaulting to 0 if omitted, and encoded in the "imm8" field as <imm>/4.

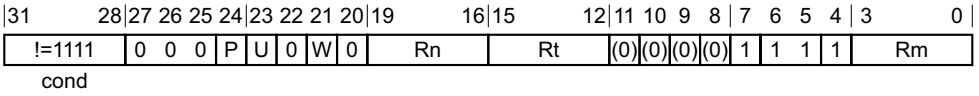
Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    if address == Align(address, 8) then
        bits(64) data;
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

```
        if BigEndian() then
            data<63:32> = R[t];
            data<31:0> = R[t2];
        else
            data<31:0> = R[t];
            data<63:32> = R[t2];
        MemA[address,8] = data;
    else
        MemA[address,4] = R[t];
        MemA[address+4,4] = R[t2];
    if wback then R[n] = offset_addr;
```

Operational information



If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.234 STRD (register)

Store Register Dual (register) calculates an address from a base register value and a register offset, and stores two words from two registers to memory. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see *Memory accesses* on page F2-3665.

A1

Offset variant

Applies when `P == 1 && W == 0`.

```
STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>, {+/-}<Rm>]
```

Post-indexed variant

Applies when `P == 0 && W == 0`.

```
STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>], {+/-}<Rm>
```

Pre-indexed variant

Applies when `P == 1 && W == 1`.

```
STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>, {+/-}<Rm>]!
```

Decode for all variants of this encoding

```
if Rt<0> == '1' then UNPREDICTABLE;
t = UInt(Rt);  t2 = t+1;  n = UInt(Rn);  m = UInt(Rm);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
if P == '0' && W == '1' then UNPREDICTABLE;
if t2 == 15 || m == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t || n == t2) then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `t == 15 || t2 == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

If `wback && (n == t || n == t2)`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The store instruction executes but the value stored is UNKNOWN.

If `wback && n == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction executes without writeback of the base address.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

If `Rt<0> == '1'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction executes with the additional decode: t<0> = '0'.
- The instruction executes with the additional decode: t2 = t.
- The instruction executes as described, with no change to its behavior and no additional side-effects. This does not apply when Rt == '1111'.

If `P == '0' && W == '1'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction executes with the additional decode: P = '1'; W = '0'.
- The instruction executes with the additional decode: P = '1'; W = '1'.
- The instruction executes with the additional decode: P = '0'; W = '0'.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

F5.1.235 STREX

Store Register Exclusive calculates an address from a base register value and an immediate offset, stores a word from a register to the calculated address if the PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

For more information about support for shared memory see *Synchronization and semaphores* on page E2-3605. For information about memory accesses see *Memory accesses* on page F2-3665.

A1

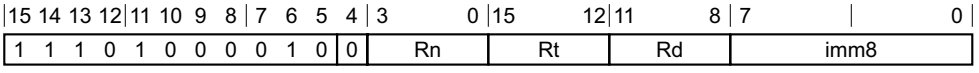
A1 variant

```
STREX{<c>}{<q>} <Rd>, <Rt>, [<Rn> {, {#}<imm>}]
```

Decode for this encoding

```
d = UInt(Rd);  t = UInt(Rt);  n = UInt(Rn);  imm32 = Zeros(32); // Zero offset
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior



If `d == t`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The store instruction executes but the value stored is UNKNOWN.

If `d == n`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction performs the store to an UNKNOWN address.

T1

T1 variant

```
STREX{<c>}{<q>} <Rd>, <Rt>, [<Rn> {, #<imm>}]
```

Decode for this encoding

```
d = UInt(Rd);  t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm8:'00', 32);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
if d == n || d == t then UNPREDICTABLE;
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

CONSTRAINED UNPREDICTABLE behavior

If `d == t`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The store instruction executes but the value stored is UNKNOWN.

If `d == n`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction performs the store to an UNKNOWN address.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<Rd>` Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is:

- `0` If the operation updates memory.
- `1` If the operation fails to update memory.

`<Rt>` Is the general-purpose register to be transferred, encoded in the "Rt" field.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

`<imm>` For encoding A1: the immediate offset added to the value of `<Rn>` to calculate the address. `<imm>` can only be 0 or omitted.

For encoding T1: the immediate offset added to the value of `<Rn>` to calculate the address. `<imm>` can be omitted, meaning an offset of 0. Values are multiples of 4 in the range 0-1020.

Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- `<Rd>` is not updated.

A non word-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If `AArch32.ExclusiveMonitorsPass()` returns `TRUE`, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If `AArch32.ExclusiveMonitorsPass()` returns `FALSE` and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

F5.1.236 STREXB

Store Register Exclusive Byte derives an address from a base register value, stores a byte from a register to the derived address if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

For more information about support for shared memory see *Synchronization and semaphores* on page E2-3605. For information about memory accesses see *Memory accesses* on page F2-3665.

A1

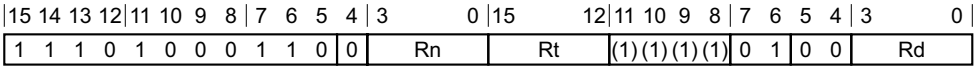
A1 variant

```
STREXB{<c>}{<q>} <Rd>, <Rt>, [<Rn>]
```

Decode for this encoding

```
d = UInt(Rd);  t = UInt(Rt);  n = UInt(Rn);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior



If `d == t`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The store instruction executes but the value stored is UNKNOWN.

If `d == n`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction performs the store to an UNKNOWN address.

T1

T1 variant

```
STREXB{<c>}{<q>} <Rd>, <Rt>, [<Rn>]
```

Decode for this encoding

```
d = UInt(Rd);  t = UInt(Rt);  n = UInt(Rn);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
if d == n || d == t then UNPREDICTABLE;
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

CONSTRAINED UNPREDICTABLE behavior

If `d == t`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The store instruction executes but the value stored is UNKNOWN.

If `d == n`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction performs the store to an UNKNOWN address.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<Rd>` Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is:

- `0` If the operation updates memory.
- `1` If the operation fails to update memory.

`<Rt>` Is the general-purpose register to be transferred, encoded in the "Rt" field.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

Aborts

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- `<Rd>` is not updated.

If `AArch32.ExclusiveMonitorsPass()` returns `FALSE` and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    if AArch32.ExclusiveMonitorsPass(address,1) then
        MemA[address,1] = R[t]<7:0>;
        R[d] = ZeroExtend('0');
    else
        R[d] = ZeroExtend('1');
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.237 STREXD

Store Register Exclusive Doubleword derives an address from a base register value, stores a 64-bit doubleword from two registers to the derived address if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

For more information about support for shared memory see *Synchronization and semaphores* on page E2-3605. For information about memory accesses see *Memory accesses* on page F2-3665.

A1

A1 variant

```
STREXD{<c>}{<q>} <Rd>, <Rt>, <Rt2>, [<Rn>]
```

Decode for this encoding

```
d = UInt(Rd);  t = UInt(Rt);  t2 = t+1;  n = UInt(Rn);
if d == 15 || Rt<0> == '1' || t2 == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t || d == t2 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

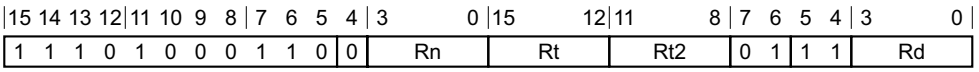
If `d == t`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The store instruction executes but the value stored is UNKNOWN.

If `d == n`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction performs the store to an UNKNOWN address.

If `Rt<0> == '1'`, then one of the following behaviors must occur:



- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction executes with the additional decode: Rt<0> = '0'.
- The instruction executes with the additional decode: t2 = t.
- The instruction executes as described, with no change to its behavior and no additional side effects.

If `Rt == '1110'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction is handled as described in *Using R15* on page K1-7191.

T1

T1 variant

```
STREXD{<c>}{<q>} <Rd>, <Rt>, <Rt2>, [<Rn>]
```

Decode for this encoding

```
d = UInt(Rd);  t = UInt(Rt);  t2 = UInt(Rt2);  n = UInt(Rn);
if d == 15 || t == 15 || t2 == 15 || n == 15 then UNPREDICTABLE;
// Armv8-A removes UNPREDICTABLE for R13
if d == n || d == t || d == t2 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `d == t`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The store instruction executes but the value stored is UNKNOWN.

If `d == n`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction performs the store to an UNKNOWN address.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<Rd>` Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is:

`0` If the operation updates memory.

`1` If the operation fails to update memory.

`<Rd>` must not be the same as `<Rn>`, `<Rt>`, or `<Rt2>`.

`<Rt>` For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. `<Rt>` must be even-numbered and not R14.

For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.

`<Rt2>` For encoding A1: is the second general-purpose register to be transferred. `<Rt2>` must be `<R(t+1)>`.

For encoding T1: is the second general-purpose register to be transferred, encoded in the "Rt2" field.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <Rd> is not updated.

A non doubleword-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If AArch32.ExclusiveMonitorsPass() returns TRUE, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If AArch32.ExclusiveMonitorsPass() returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    // Create doubleword to store such that R[t] will be stored at address and R[t2] at address+4.
    value = if BigEndian() then R[t]:R[t2] else R[t2]:R[t];
    if AArch32.ExclusiveMonitorsPass(address,8) then
        MemA[address,8] = value;  R[d] = ZeroExtend('0');
    else
        R[d] = ZeroExtend('1');
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.238 STREXH

Store Register Exclusive Halfword derives an address from a base register value, stores a halfword from a register to the derived address if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

For more information about support for shared memory see *Synchronization and semaphores* on page E2-3605. For information about memory accesses see *Memory accesses* on page F2-3665.

A1

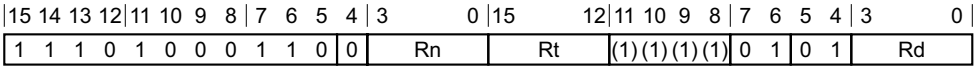
A1 variant

```
STREXH{<c>}{<q>} <Rd>, <Rt>, [<Rn>]
```

Decode for this encoding

```
d = UInt(Rd);  t = UInt(Rt);  n = UInt(Rn);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior



If `d == t`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The store instruction executes but the value stored is UNKNOWN.

If `d == n`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction performs the store to an UNKNOWN address.

T1

T1 variant

```
STREXH{<c>}{<q>} <Rd>, <Rt>, [<Rn>]
```

Decode for this encoding

```
d = UInt(Rd);  t = UInt(Rt);  n = UInt(Rn);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
if d == n || d == t then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `d == t`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The store instruction executes but the value stored is UNKNOWN.

If `d == n`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction performs the store to an UNKNOWN address.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<Rd>` Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is:

- `0` If the operation updates memory.
- `1` If the operation fails to update memory.

`<Rt>` Is the general-purpose register to be transferred, encoded in the "Rt" field.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- `<Rd>` is not updated.

A non halfword-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If `AArch32.ExclusiveMonitorsPass()` returns `TRUE`, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If `AArch32.ExclusiveMonitorsPass()` returns `FALSE` and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    if AArch32.ExclusiveMonitorsPass(address,2) then
        MemA[address,2] = R[t]<15:0>;
```

F5.1.239 STRH (immediate)

Store Register Halfword (immediate) calculates an address from a base register value and an immediate offset, and stores a halfword from a register to memory. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see *Memory accesses* on page F2-3665.

A1

Offset variant

Applies when `P == 1 && W == 0`.

```
STRH{<c>}{<q>} <Rt>, [<Rn> {, #{+/-}<imm>}]
```

Post-indexed variant

Applies when `P == 0 && W == 0`.

```
STRH{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>
```

Pre-indexed variant

Applies when `P == 1 && W == 1`.

```
STRH{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!
```

Decode for all variants of this encoding

```
if P == '0' && W == '1' then SEE "STRHT";
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm4H:imm4L, 32);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
if t == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
```

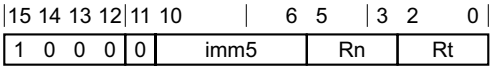
CONSTRAINED UNPREDICTABLE behavior

If `t == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

If `wback && n == t`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The store instruction executes but the value stored is UNKNOWN.



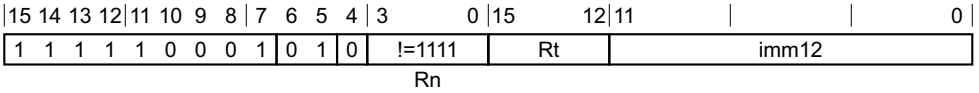
If `wback && n == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction executes without writeback of the base address.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

T1



T1 variant

```
STRH{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

Decode for this encoding

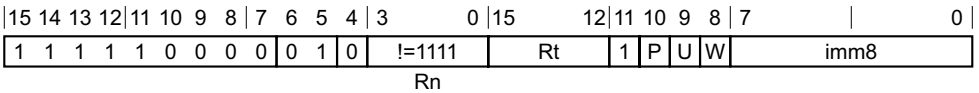
```
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm5:'0', 32);
index = TRUE;  add = TRUE;  wback = FALSE;
```

T2

T2 variant

```
STRH{<c>}.W <Rt>, [<Rn> {, #{+}<imm>}] // <Rt>, <Rn>, <imm> can be represented in T1
STRH{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

Decode for this encoding



```
if Rn == '1111' then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm12, 32);
index = TRUE;  add = TRUE;  wback = FALSE;
if t == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If `t == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

T3

Offset variant

Applies when `P == 1 && U == 0 && W == 0`.

```
STRH{<c>}{<q>} <Rt>, [<Rn> {, #-<imm>}]
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Post-indexed variant

Applies when `P == 0 && W == 1`.

```
STRH{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>
```

Pre-indexed variant

Applies when `P == 1 && W == 1`.

```
STRH{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!
```

Decode for all variants of this encoding

```
if P == '1' && U == '1' && W == '0' then SEE "STRHT";
if Rn == '1111' || (P == '0' && W == '0') then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm8, 32);
index = (P == '1');  add = (U == '1');  wback = (W == '1');
if t == 15 || (wback && n == t) then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If `t == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

If `wback && n == t`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The store instruction executes but the value stored is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<Rt>` Is the general-purpose register to be transferred, encoded in the "Rt" field.

`<Rn>` For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated.

For encoding A1, T1, T2, T3: is the general-purpose base register, encoded in the "Rn" field.

`+/-` Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`+` Specifies the offset is added to the base register.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

<imm> For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is the optional positive unsigned immediate byte offset, a multiple of 2, in the range 0 to 62, defaulting to 0 and encoded in the "imm5" field as <imm>/2.

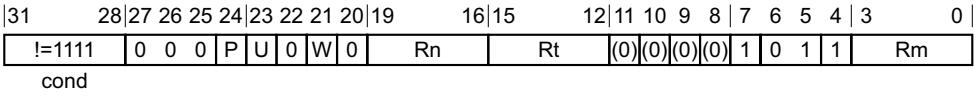
For encoding T2: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.

For encoding T3: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

Operation for all encodings

```
if CurrentInstrSet() == InstrSet_A32 then
    if ConditionPassed() then
        EncodingSpecificOperations();
        offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
        address = if index then offset_addr else R[n];
        MemU[address,2] = R[t]<15:0>;
        if wback then R[n] = offset_addr;
else
    if ConditionPassed() then
        EncodingSpecificOperations();
        offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
        address = if index then offset_addr else R[n];
        MemU[address,2] = R[t]<15:0>;
        if wback then R[n] = offset_addr;
```

Operational information



If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

Non-Confidential

F5.1.240 STRH (register)

Store Register Halfword (register) calculates an address from a base register value and an offset register value, and stores a halfword from a register to memory. The offset register value can be shifted left by 0, 1, 2, or 3 bits. For information about memory accesses see *Memory accesses* on page F2-3665.

A1

Offset variant

Applies when `P == 1 && W == 0`.

```
STRH{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>]
```

Post-indexed variant

Applies when `P == 0 && W == 0`.

```
STRH{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>
```

Pre-indexed variant

Applies when `P == 1 && W == 1`.

```
STRH{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>]!
```

Decode for all variants of this encoding

```
if P == '0' && W == '1' then SEE "STRHT";
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
(shift_t, shift_n) = (SRType_LSL, 0);
if t == 15 || m == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
```

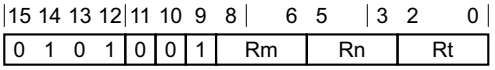
CONSTRAINED UNPREDICTABLE behavior

If `t == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

If `wback && n == t`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The store instruction executes but the value stored is UNKNOWN.



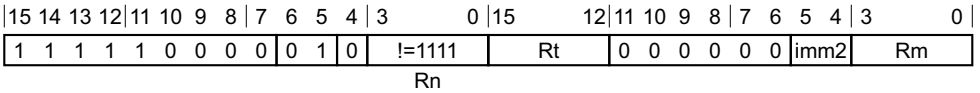
If `wback && n == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction executes without writeback of the base address.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

T1



T1 variant

```
STRH{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>]
```

Decode for this encoding

```
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = TRUE;  add = TRUE;  wback = FALSE;
(shift_t, shift_n) = (SRType_LSL, 0);
```

T2

T2 variant

```
STRH{<c>}.W <Rt>, [<Rn>, {+}<Rm>] // <Rt>, <Rn>, <Rm> can be represented in T1
STRH{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>{, LSL #<imm>}]
```

Decode for this encoding

```
if Rn == '1111' then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = TRUE;  add = TRUE;  wback = FALSE;
(shift_t, shift_n) = (SRType_LSL, UInt(imm2));
if t == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If `t == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<Rt>` Is the general-purpose register to be transferred, encoded in the "Rt" field.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

`<Rn>` For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated.

For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.

`+/-` Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`+` Specifies the index register is added to the base register.

`<Rm>` Is the general-purpose index register, encoded in the "Rm" field.

`<imm>` If present, the size of the left shift to apply to the value from `<Rm>`, in the range 1-3. `<imm>` is encoded in imm2. If absent, no shift is specified and imm2 is encoded as `0b00`.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if index then offset_addr else R[n];
    MemU[address,2] = R[t]<15:0>;
    if wback then R[n] = offset_addr;
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

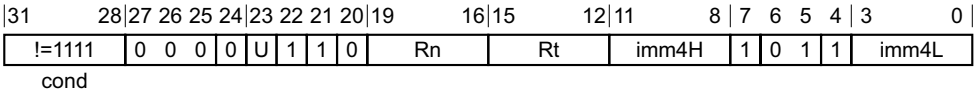
F5.1.241 STRHT

Store Register Halfword Unprivileged stores a halfword from a register to memory. For information about memory accesses see *Memory accesses* on page F2-3665.



The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

`STRHT` is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or a register value.

A1

A1 variant

```
STRHT{<c>}{<q>} <Rt>, [<Rn>] {, #{+/-}<imm>}
```

Decode for this encoding

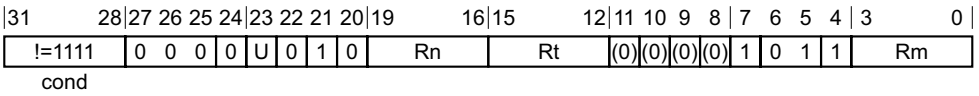
```
t = UInt(Rt);  n = UInt(Rn);  postindex = TRUE;  add = (U == '1');
register_form = FALSE;  imm32 = ZeroExtend(imm4H:imm4L, 32);
if t == 15 || n == 15 || n == t then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `t == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

If `n == t`, then one of the following behaviors must occur:



- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The store instruction executes but the value stored is UNKNOWN.

If `n == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction executes without writeback of the base address.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

A2

A2 variant

```
STRHT{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>
```

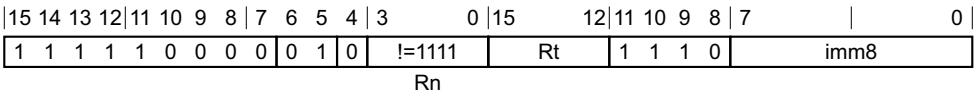
Decode for this encoding

```
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);  postindex = TRUE;  add = (U == '1');
register_form = TRUE;
if t == 15 || n == 15 || n == t || m == 15 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `t == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.



If `n == t`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The store instruction executes but the value stored is UNKNOWN.

If `n == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction executes without writeback of the base address.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

T1

T1 variant

```
STRHT{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

Decode for this encoding

```
if Rn == '1111' then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);  postindex = FALSE;  add = TRUE;
register_form = FALSE;  imm32 = ZeroExtend(imm8, 32);
if t == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If `t == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<Rt>` Is the general-purpose register to be transferred, encoded in the "Rt" field.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

`+/-` For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`<Rm>` Is the general-purpose index register, encoded in the "Rm" field.

`+` Specifies the offset is added to the base register.

`<imm>` For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

Operation for all encodings

```
if ConditionPassed() then
    if PSTATE.EL == EL2 then UNPREDICTABLE;              // Hyp mode
    EncodingSpecificOperations();
    offset = if register_form then R[m] else imm32;
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if postindex then R[n] else offset_addr;
    MemU_unpriv[address,2] = R[t]<15:0>;
    if postindex then R[n] = offset_addr;
```

CONSTRAINED UNPREDICTABLE behavior

If `PSTATE.EL == EL2`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

- The instruction executes as `NOP`.
- The instruction executes as `STRH` (immediate).

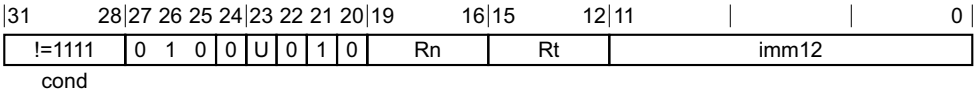
Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

F5.1.242 STRT

Store Register Unprivileged stores a word from a register to memory. For information about memory accesses see *Memory accesses* on page F2-3665.



The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

STRT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or an optionally-shifted register value.

A1

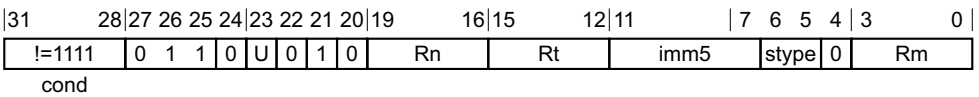
A1 variant

```
STRT{<c>}{<q>} <Rt>, [<Rn>] {, #{+/-}<imm>}
```

Decode for this encoding

```
t = UInt(Rt);  n = UInt(Rn);  postindex = TRUE;  add = (U == '1');
register_form = FALSE;  imm32 = ZeroExtend(imm12, 32);
if n == 15 || n == t then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior



If `n == t`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The store instruction executes but the value stored is UNKNOWN.

If `n == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction executes without writeback of the base address.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

A2

A2 variant

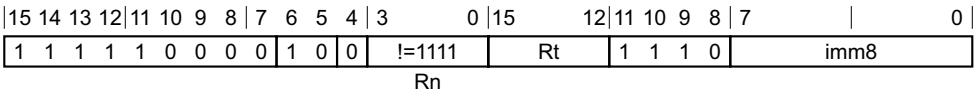
```
STRT{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>{, <shift>}
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Decode for this encoding

```
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);  postindex = TRUE;  add = (U == '1');
register_form = TRUE;  (shift_t, shift_n) = DecodeImmShift(stype, imm5);
if n == 15 || n == t || m == 15 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior



If `n == t`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The store instruction executes but the value stored is UNKNOWN.

If `n == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction executes without writeback of the base address.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

T1

T1 variant

```
STRT{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

Decode for this encoding

```
if Rn == '1111' then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);  postindex = FALSE;  add = TRUE;
register_form = FALSE;  imm32 = ZeroExtend(imm8, 32);
if t == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If `t == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-3660.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<Rt>` For encoding A1 and A2: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated.

For encoding T1: is the general-purpose register to be transferred, encoded in the "Rt" field.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

`+/-` For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when `U = 0`
- when `U = 1`

For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when `U = 0`
- when `U = 1`

`<Rm>` Is the general-purpose index register, encoded in the "Rm" field.

`<shift>` The shift to apply to the value read from `<Rm>`. If absent, no shift is applied. Otherwise, see *Shifts applied to a register* on page F2-3663.

`+` Specifies the offset is added to the base register.

`<imm>` For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.

For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

Operation for all encodings

```
if ConditionPassed() then
    if PSTATE.EL == EL2 then UNPREDICTABLE;               // Hyp mode
    EncodingSpecificOperations();
    offset = if register_form then Shift(R[m], shift_t, shift_n, PSTATE.C) else imm32;
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if postindex then R[n] else offset_addr;
    if t == 15 then  // Only possible for encodings A1 and A2
        data = PCStoreValue();
    else
        data = R[t];
    MemU_unpriv[address,4] = data;
    if postindex then R[n] = offset_addr;
```

CONSTRAINED UNPREDICTABLE behavior

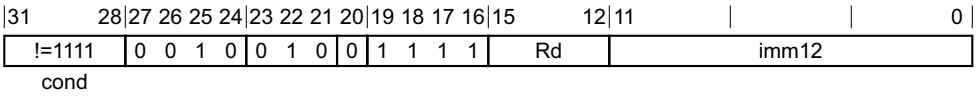
If `PSTATE.EL == EL2`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction executes as `STR` (immediate).

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential



F5.1.243 SUB (immediate, from PC)

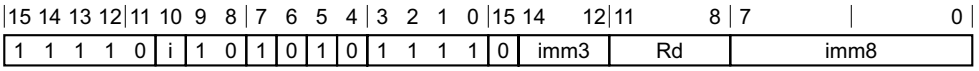
Subtract from PC subtracts an immediate value from the Align(PC, 4) value to form a PC-relative address, and writes the result to the destination register. Arm recommends that, where possible, software avoids using this alias

This instruction is an alias of the ADR instruction. This means that:

- The encodings in this description are named to match the encodings of ADR.
- The description of ADR gives the operational pseudocode for this instruction.

A2

A2 variant



```
SUB{<c>}{<q>} <Rd>, PC, #<const>
```

is equivalent to

```
ADR{<c>}{<q>} <Rd>, <label>
```

and is the preferred disassembly when `imm12 == '000000000000'`.

T2

T2 variant

```
SUB{<c>}{<q>} <Rd>, PC, #<imm12>
```

is equivalent to

```
ADR{<c>}{<q>} <Rd>, <label>
```

and is the preferred disassembly when `i:imm3:imm8 == '000000000000'`.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<Rd>` For encoding A2: is the general-purpose destination register, encoded in the "Rd" field. If the PC is used, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-3541.

For encoding T2: is the general-purpose destination register, encoded in the "Rd" field.

`<label>` For encoding A2: the label of an instruction or literal data item whose address is to be loaded into `<Rd>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the `ADR` instruction to this label.

If the offset is zero or positive, encoding A1 is used, with `imm32` equal to the offset.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

If the offset is negative, encoding A2 is used, with `imm32` equal to the size of the offset. That is, the use of encoding A2 indicates that the required offset is minus the value of `imm32`.

Permitted values of the size of the offset are any of the constants described in *Modified immediate constants in A32 instructions* on page F2-3676.

For encoding T2: the label of an instruction or literal data item whose address is to be loaded into `<Rd>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the `ADR` instruction to this label.

If the offset is zero or positive, encoding T3 is used, with `imm32` equal to the offset.

If the offset is negative, encoding T2 is used, with `imm32` equal to the size of the offset. That is, the use of encoding T2 indicates that the required offset is minus the value of `imm32`.

Permitted values of the size of the offset are 0-4095.

`<imm12>` Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the "i:imm3:imm8" field.

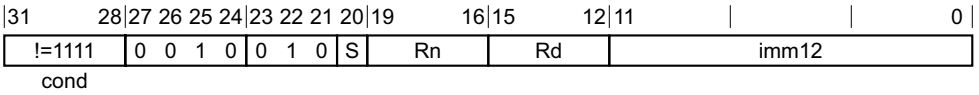
`<const>` An immediate value. See *Modified immediate constants in A32 instructions* on page F2-3676 for the range of values.

Operation for all encodings

The description of ADR gives the operational pseudocode for this instruction.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

F5.1.244 SUB, SUBS (immediate)



Subtract (immediate) subtracts an immediate value from a register value, and writes the result to the destination register.

If the destination register is not the PC, the SUBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The SUB variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-3541.
- The SUBS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-5270.
  - The instruction is UNDEFINED in Hyp mode, except for encoding T5 with <imm8> set to zero, which is the encoding for the ERET instruction, see ERET.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

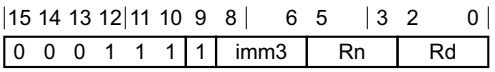
A1

SUB variant

Applies when S == 0 && Rn != 11x1.

```
SUB{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

SUBS variant



Applies when S == 1 && Rn != 1101.

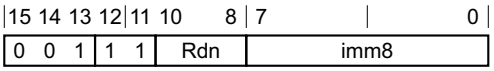
```
SUBS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

Decode for all variants of this encoding

```
if Rn == '1111' && S == '0' then SEE "ADR";
if Rn == '1101' then SEE "SUB (SP minus immediate)";
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');  imm32 = A32ExpandImm(imm12);
```

T1

T1 variant



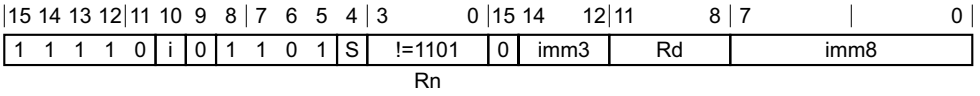
```
SUB<c>{<q>} <Rd>, <Rn>, #<imm3> // Inside IT block
SUBS{<q>} <Rd>, <Rn>, #<imm3> // Outside IT block
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  setflags = !InITBlock();  imm32 = ZeroExtend(imm3, 32);
```

T2



T2 variant

```
SUB<c>{<q>} <Rdn>, #<imm8> // Inside IT block, and <Rdn>, <imm8> can be represented in T1
SUB<c>{<q>} {<Rdn>,} <Rdn>, #<imm8> // Inside IT block, and <Rdn>, <imm8> cannot be represented in T1
SUBS{<q>} <Rdn>, #<imm8> // Outside IT block, and <Rdn>, <imm8> can be represented in T1
SUBS{<q>} {<Rdn>,} <Rdn>, #<imm8> // Outside IT block, and <Rdn>, <imm8> cannot be represented in T1
```

Decode for this encoding

```
d = UInt(Rdn);  n = UInt(Rdn);  setflags = !InITBlock();  imm32 = ZeroExtend(imm8, 32);
```

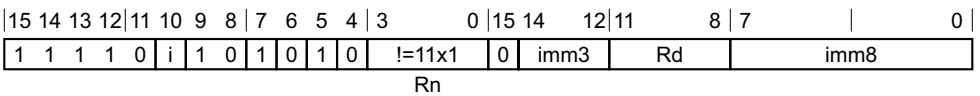
T3

SUB variant

Applies when `S == 0`.

```
SUB<c>.W {<Rd>,} <Rn>, #<const> // Inside IT block, and <Rd>, <Rn>, <const> can be represented in T1 or
T2
SUB{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

SUBS variant



Applies when `S == 1 && Rd != 1111`.

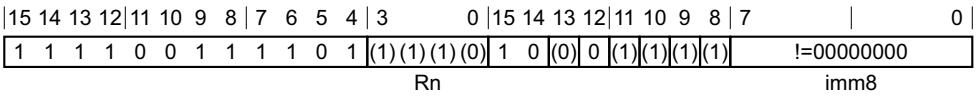
```
SUBS.W {<Rd>,} <Rn>, #<const> // Outside IT block, and <Rd>, <Rn>, <const> can be represented in T1 or T2
SUBS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

Decode for all variants of this encoding

```
if Rd == '1111' && S == '1' then SEE "CMP (immediate)";
if Rn == '1101' then SEE "SUB (SP minus immediate)";
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');  imm32 = T32ExpandImm(i:imm3:imm8);
if (d == 15 && !setflags) || n == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

T4

T4 variant



```
SUB{<c>}{<q>} {<Rd>,} <Rn>, #<imm12> // <imm12> cannot be represented in T1, T2, or T3
SUBW{<c>}{<q>} {<Rd>,} <Rn>, #<imm12> // <imm12> can be represented in T1, T2, or T3
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.

Decode for this encoding

```
if Rn == '1111' then SEE "ADR";
if Rn == '1101' then SEE "SUB (SP minus immediate)";
d = UInt(Rd);  n = UInt(Rn);  setflags = FALSE;  imm32 = ZeroExtend(i:imm3:imm8, 32);
if d == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

T5

T5 variant

```
SUBS{<c>}{<q>} PC, LR, #<imm8>
```

Decode for this encoding

```
if Rn == '1110' && IsZero(imm8) then SEE "ERET";
d = 15;  n = UInt(Rn);  setflags = TRUE;  imm32 = ZeroExtend(imm8, 32);
if n != 14 then UNPREDICTABLE;
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *SUBS PC. LR and related instructions (A32)* on page K1-7204 and *SUBS PC, LR and related instructions (T32)* on page K1-7203.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<Rdn> Is the general-purpose source and destination register, encoded in the "Rdn" field.

<imm8> For encoding T2: is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field.

For encoding T5: is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field. If <Rn> is the LR, and zero is used, see ERET.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. If the PC is used:

- For the SUB variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-3541.
- For the SUBS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. Arm deprecates use of this instruction unless <Rn> is the LR.

For encoding T1, T3 and T4: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1 and T4: is the general-purpose source register, encoded in the "Rn" field. If the SP is used, see SUB, SUBS (SP minus immediate). If the PC is used, see ADR.

For encoding T1: is the general-purpose source register, encoded in the "Rn" field.

For encoding T3: is the general-purpose source register, encoded in the "Rn" field. If the SP is used, see SUB, SUBS (SP minus immediate).

<imm3> Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "imm3" field.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

<imm12> Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the "i:imm3:imm8" field.

<const> For encoding A1: an immediate value. See *Modified immediate constants in A32 instructions* on page F2-3676 for the range of values.

For encoding T3: an immediate value. See *Modified immediate constants in T32 instructions* on page F2-3675 for the range of values.

In the T32 instruction set, `MOVS{<c>}{<q>} PC, LR` is a pseudo-instruction for `SUBS{<c>}{<q>} PC, LR, #0`.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcv) = AddWithCarry(R[n], NOT(imm32), '1');
    if d == 15 then
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```

Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

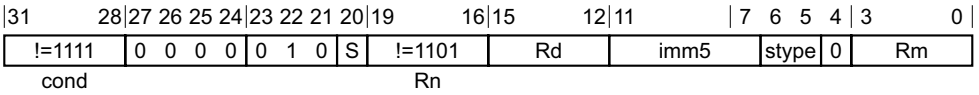
F5.1.245 SUB, SUBS (register)



Subtract (register) subtracts an optionally-shifted register value from a register value, and writes the result to the destination register.

If the destination register is not the PC, the SUBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. However, when the destination register is the PC:

- The SUB variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-3541.
- The SUBS variant of the instruction performs an exception return without the use of the stack. Arm deprecates use of this instruction. However, in this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-5270.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1

SUB, rotate right with extend variant

Applies when `S == 0 && imm5 == 00000 && stype == 11`.

```
SUB{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

SUB, shift or rotate by value variant

Applies when `S == 0 && !(imm5 == 00000 && stype == 11)`.

```
SUB{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

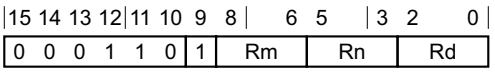
SUBS, rotate right with extend variant

Applies when `S == 1 && imm5 == 00000 && stype == 11`.

```
SUBS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

SUBS, shift or rotate by value variant

Applies when `S == 1 && !(imm5 == 00000 && stype == 11)`.



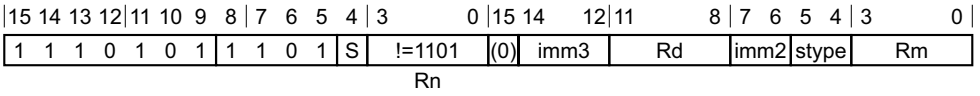
```
SUBS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
if Rn == '1101' then SEE "SUB (SP minus register)";
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(stype, imm5);
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

T1



T1 variant

```
SUB<c>{<q>} <Rd>, <Rn>, <Rm> // Inside IT block
SUBS{<q>} {<Rd>,} <Rn>, <Rm> // Outside IT block
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = !InITBlock();
(shift_t, shift_n) = (SRType_LSL, 0);
```

T2

SUB, rotate right with extend variant

Applies when `S == 0 && imm3 == 000 && imm2 == 00 && stype == 11`.

```
SUB{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

SUB, shift or rotate by value variant

Applies when `S == 0 && !(imm3 == 000 && imm2 == 00 && stype == 11)`.

```
SUB<c>.W {<Rd>,} <Rn>, <Rm> // Inside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
SUB{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

SUBS, rotate right with extend variant

Applies when `S == 1 && imm3 == 000 && Rd != 1111 && imm2 == 00 && stype == 11`.

```
SUBS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

SUBS, shift or rotate by value variant

Applies when `S == 1 && !(imm3 == 000 && imm2 == 00 && stype == 11) && Rd != 1111`.

```
SUBS.W {<Rd>,} <Rn>, <Rm> // Outside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
SUBS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
if Rd == '1111' && S == '1' then SEE "CMP (register)";
if Rn == '1101' then SEE "SUB (SP minus register)";
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(stype, imm3:imm2);
if (d == 15 && !setflags) || n == 15 || m == 15 then UNPREDICTABLE;
// Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Non-Confidential

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. Arm deprecates using the PC as the destination register, but if the PC is used:

- For the SUB variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-3541.
- For the SUBS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1 and T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated. If the SP is used, see SUB, SUBS (SP minus register).

For encoding T1: is the first general-purpose source register, encoded in the "Rn" field.

For encoding T2: is the first general-purpose source register, encoded in the "Rn" field. If the SP is used, see SUB, SUBS (SP minus register).

<Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values:

LSL when stype = 00

LSR when stype = 01

ASR when stype = 10

ROR when stype = 11

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], NOT(shifted), '1');
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```

F5.1.246 SUB, SUBS (register-shifted register)

Subtract (register-shifted register) subtracts a register-shifted register value from a register value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

A1

Flag setting variant

Applies when `S == 1`.

```
SUBS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <shift> <Rs>
```

Not flag setting variant

Applies when `S == 0`.

```
SUB{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <shift> <Rs>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(stype);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.

`<Rn>` Is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` Is the second general-purpose source register, encoded in the "Rm" field.

`<shift>` Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values:

- `LSL` when `stype = 00`
- `LSR` when `stype = 01`
- `ASR` when `stype = 10`
- `ROR` when `stype = 11`

`<Rs>` Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Non-Confidential

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], NOT(shifted), '1');
    R[d] = result;
    if setflags then
        PSTATE.<N,Z,C,V> = nzcv;
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

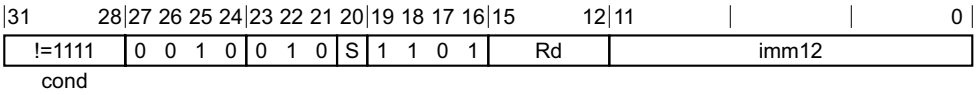
F5.1.247 SUB, SUBS (SP minus immediate)



Subtract from SP (immediate) subtracts an immediate value from the SP value, and writes the result to the destination register.

If the destination register is not the PC, the SUBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The SUB variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-3541.
- The SUBS variant of the instruction performs an exception return without the use of the stack. Arm deprecates use of this instruction. However, in this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-5270.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

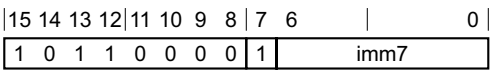
A1

SUB variant

Applies when S == 0.

```
SUB{<c>}{<q>} {<Rd>,} SP, #<const>
```

SUBS variant



Applies when S == 1.

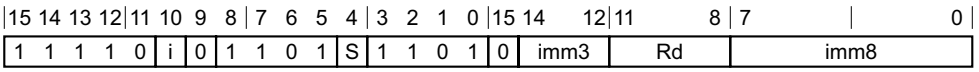
```
SUBS{<c>}{<q>} {<Rd>,} SP, #<const>
```

Decode for all variants of this encoding

```
d = UInt(Rd);  setflags = (S == '1');  imm32 = A32ExpandImm(imm12);
```

T1

T1 variant



```
SUB{<c>}{<q>} {SP,} SP, #<imm7>
```

Decode for this encoding

```
d = 13;  setflags = FALSE;  imm32 = ZeroExtend(imm7:'00', 32);
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

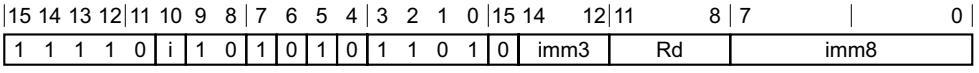
T2

SUB variant

Applies when `S == 0`.

```
SUB{<c>}.W {<Rd>,} SP, #<const> // <Rd>, <const> can be represented in T1
SUB{<c>}{<q>} {<Rd>,} SP, #<const>
```

SUBS variant



Applies when `S == 1 && Rd != 1111`.

```
SUBS{<c>}{<q>} {<Rd>,} SP, #<const>
```

Decode for all variants of this encoding

```
if Rd == '1111' && S == '1' then SEE "CMP (immediate)";
d = UInt(Rd);  setflags = (S == '1');  imm32 = T32ExpandImm(i:imm3:imm8);
if d == 15 && !setflags then UNPREDICTABLE;
```

T3

T3 variant

```
SUB{<c>}{<q>} {<Rd>,} SP, #<imm12> // <imm12> cannot be represented in T1, T2, or T3
SUBW{<c>}{<q>} {<Rd>,} SP, #<imm12> // <imm12> can be represented in T1, T2, or T3
```

Decode for this encoding

```
d = UInt(Rd);  setflags = FALSE;  imm32 = ZeroExtend(i:imm3:imm8, 32);
if d == 15 then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-3660.
<q>	See *Standard assembler syntax fields* on page F2-3660.
SP,	Is the stack pointer.
<imm7>	Is the unsigned immediate, a multiple of 4, in the range 0 to 508, encoded in the "imm7" field as <imm7>/4.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP. If the PC is used:

- For the SUB variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-3541.
- For the SUBS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. Arm deprecates use of this instruction unless <Rn> is the LR.

For encoding T2 and T3: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP.

<imm12> Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the "i:imm3:imm8" field.

<const> For encoding A1: an immediate value. See *Modified immediate constants in A32 instructions* on page F2-3676 for the range of values.

For encoding T2: an immediate value. See *Modified immediate constants in T32 instructions* on page F2-3675 for the range of values.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcv) = AddWithCarry(SP, NOT(imm32), '1');
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```

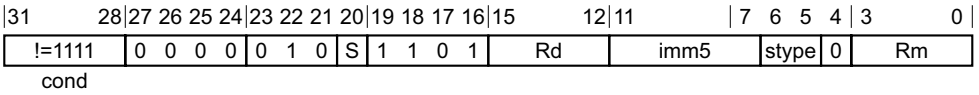
F5.1.248 SUB, SUBS (SP minus register)



Subtract from SP (register) subtracts an optionally-shifted register value from the SP value, and writes the result to the destination register.

If the destination register is not the PC, the SUBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The SUB variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-3541.
- The SUBS variant of the instruction performs an exception return without the use of the stack. Arm deprecates use of this instruction. However, in this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-5270.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1

SUB, rotate right with extend variant

Applies when `S == 0 && imm5 == 00000 && stype == 11`.

```
SUB{<c>}{<q>} {<Rd>,} SP, <Rm> , RRX
```

SUB, shift or rotate by value variant

Applies when `S == 0 && !(imm5 == 00000 && stype == 11)`.

```
SUB{<c>}{<q>} {<Rd>,} SP, <Rm> {, <shift> #<amount>}
```

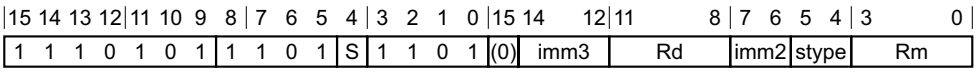
SUBS, rotate right with extend variant

Applies when `S == 1 && imm5 == 00000 && stype == 11`.

```
SUBS{<c>}{<q>} {<Rd>,} SP, <Rm> , RRX
```

SUBS, shift or rotate by value variant

Applies when `S == 1 && !(imm5 == 00000 && stype == 11)`.



```
SUBS{<c>}{<q>} {<Rd>,} SP, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
d = UInt(Rd);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(stype, imm5);
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

T1

SUB, rotate right with extend variant

Applies when `S == 0 && imm3 == 000 && imm2 == 00 && stype == 11`.

```
SUB{<c>}{<q>} {<Rd>,} SP, <Rm>, RRX
```

SUB, shift or rotate by value variant

Applies when `S == 0 && !(imm3 == 000 && imm2 == 00 && stype == 11)`.

```
SUB{<c>}.W {<Rd>,} SP, <Rm> // <Rd>, <Rm> can be represented in T1 or T2
SUB{<c>}{<q>} {<Rd>,} SP, <Rm> {, <shift> #<amount>}
```

SUBS, rotate right with extend variant

Applies when `S == 1 && imm3 == 000 && Rd != 1111 && imm2 == 00 && stype == 11`.

```
SUBS{<c>}{<q>} {<Rd>,} SP, <Rm>, RRX
```

SUBS, shift or rotate by value variant

Applies when `S == 1 && !(imm3 == 000 && imm2 == 00 && stype == 11) && Rd != 1111`.

```
SUBS{<c>}{<q>} {<Rd>,} SP, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
if Rd == '1111' && S == '1' then SEE "CMP (register)";
d = UInt(Rd);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(stype, imm3:imm2);
if (d == 15 && !setflags) || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP. Arm deprecates using the PC as the destination register, but if the PC is used:

- For the SUB variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-3541.
- For the SUBS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP.

`<Rm>` For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

For encoding T1: is the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values:

LSL when stype = 00

LSR when stype = 01

ASR when stype = 10

ROR when stype = 11

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(SP, NOT(shifted), '1');
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```

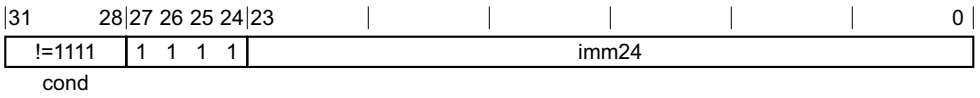
F5.1.249 SVC

Supervisor Call causes a Supervisor Call exception. For more information, see *Supervisor Call (SVC) exception* on page G1-5286.

Note

SVC was previously called SWI, Software Interrupt, and this name is still found in some documentation.

Software can use this instruction as a call to an operating system to provide a service.



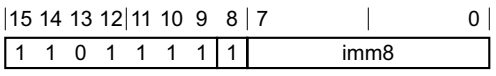
In the following cases, the Supervisor Call exception generated by the SVC instruction is taken to Hyp mode:

- If the SVC is executed in Hyp mode.
- If HCR.TGE is set to 1, and the SVC is executed in Non-secure User mode. For more information, see *Supervisor Call exception, when the value of HCR.TGE is 1* on page G1-5263

In these cases, the HSR identifies that the exception entry was caused by a Supervisor Call exception, EC value 0x11, see *Use of the HSR* on page G5-5580. The immediate field in the HSR:

- If the SVC is unconditional:
  - For the T32 instruction, is the zero-extended value of the imm8 field.
  - For the A32 instruction, is the least-significant 16 bits the imm24 field.
- If the SVC is conditional, is UNKNOWN.

A1



A1 variant

```
SVC{<c>}{<q>} {#}<imm>
```

Decode for this encoding

```
imm32 = ZeroExtend(imm24, 32);
```

T1

T1 variant

```
SVC{<c>}{<q>} {#}<imm>
```

Decode for this encoding

```
imm32 = ZeroExtend(imm8, 32);
```

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-3660.

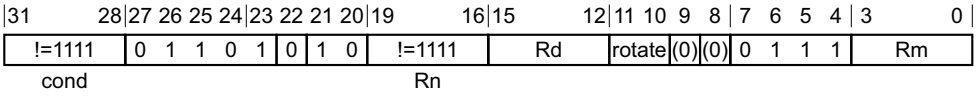
Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

<q> See *Standard assembler syntax fields* on page F2-3660.

<imm> For encoding A1: is a 24-bit unsigned immediate, in the range 0 to 16777215, encoded in the "imm24" field. This value is for assembly and disassembly only. SVC handlers in some systems interpret imm24 in software, for example to determine the required service.

For encoding T1: is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field. This value is for assembly and disassembly only. SVC handlers in some systems interpret imm8 in software, for example to determine the required service.

Operation for all encodings



```
if ConditionPassed() then
    EncodingSpecificOperations();
    AArch32.CallSupervisor(imm32<15:0>);
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.

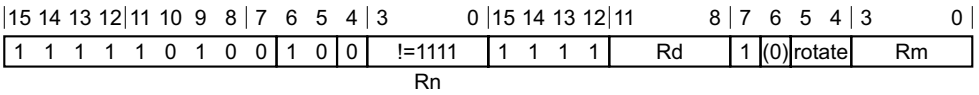
F5.1.250 SXTAB

Signed Extend and Add Byte extracts an 8-bit value from a register, sign-extends it to 32 bits, adds the result to the value in another register, and writes the final result to the destination register. The instruction can specify a rotation by 0, 8, 16, or 24 bits before extracting the 8-bit value.

A1



A1 variant

```
SXTAB{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, ROR #<amount>}
```

Decode for this encoding

```
if Rn == '1111' then SEE "SXTB";
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE;
```

T1

T1 variant

```
SXTAB{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, ROR #<amount>}
```

Decode for this encoding

```
if Rn == '1111' then SEE "SXTB";
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>`	See *Standard assembler syntax fields* on page F2-3660.
`<q>`	See *Standard assembler syntax fields* on page F2-3660.

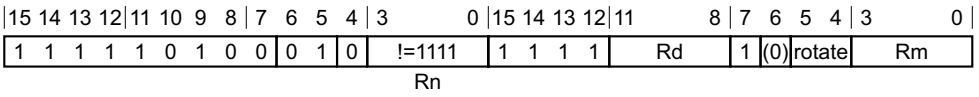
F5.1.251 SXTAB16

Signed Extend and Add Byte 16 extracts two 8-bit values from a register, sign-extends them to 16 bits each, adds the results to two 16-bit values from another register, and writes the final results to the destination register. The instruction can specify a rotation by 0, 8, 16, or 24 bits before extracting the 8-bit values.

A1



A1 variant

```
SXTAB16{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, ROR #<amount>}
```

Decode for this encoding

```
if Rn == '1111' then SEE "SXTB16";
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE;
```

T1

T1 variant

```
SXTAB16{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, ROR #<amount>}
```

Decode for this encoding

```
if Rn == '1111' then SEE "SXTB16";
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<Rd> Is the general-purpose destination register, encoded in the "Rd" field.

<Rm> Is the general-purpose source register, encoded in the "Rm" field.

<amount> Is the rotate amount, encoded in the "rotate" field. It can have the following values:

(omitted)	when rotate = 00
8	when rotate = 01
16	when rotate = 10
24	when rotate = 11

Operation for all encodings

```
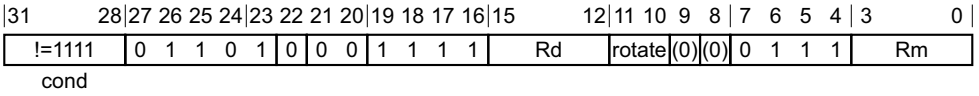
if ConditionPassed() then
    EncodingSpecificOperations();
    rotated = ROR(R[m], rotation);
    R[d] = SignExtend(rotated<7:0>, 32);
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:



- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

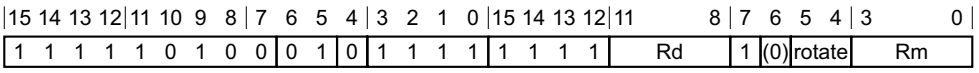
F5.1.254 SXTB16

Signed Extend Byte 16 extracts two 8-bit values from a register, sign-extends them to 16 bits each, and writes the results to the destination register. The instruction can specify a rotation by 0, 8, 16, or 24 bits before extracting the 8-bit values.

A1



A1 variant

```
SXTB16{<c>}{<q>} {<Rd>,} <Rm> {, ROR #<amount>}
```

Decode for this encoding

```
d = UInt(Rd);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE;
```

T1

T1 variant

```
SXTB16{<c>}{<q>} {<Rd>,} <Rm> {, ROR #<amount>}
```

Decode for this encoding

```
d = UInt(Rd);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.

`<Rm>` Is the general-purpose source register, encoded in the "Rm" field.

`<amount>` Is the rotate amount, encoded in the "rotate" field. It can have the following values:

- `(omitted)` when `rotate = 00`
- `8` when `rotate = 01`
- `16` when `rotate = 10`
- `24` when `rotate = 11`

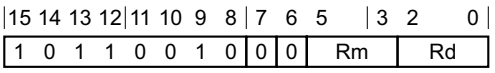
F5.1.255 SXTH

Signed Extend Halfword extracts a 16-bit value from a register, sign-extends it to 32 bits, and writes the result to the destination register. The instruction can specify a rotation by 0, 8, 16, or 24 bits before extracting the 16-bit value.

A1



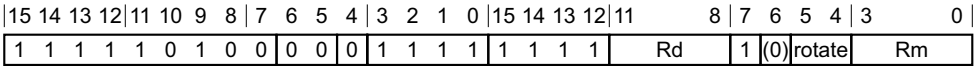
A1 variant

```
SXTH{<c>}{<q>} {<Rd>,} <Rm> {, ROR #<amount>}
```

Decode for this encoding

```
d = UInt(Rd);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE;
```

T1



T1 variant

```
SXTH{<c>}{<q>} {<Rd>,} <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  m = UInt(Rm);  rotation = 0;
```

T2

T2 variant

```
SXTH{<c>}.W {<Rd>,} <Rm> // <Rd>, <Rm> can be represented in T1
SXTH{<c>}{<q>} {<Rd>,} <Rm> {, ROR #<amount>}
```

Decode for this encoding

```
d = UInt(Rd);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

F5.1.256 TBB, TBH

Table Branch Byte or Halfword causes a PC-relative forward branch using a table of single byte or halfword offsets. A base register provides a pointer to the table, and a second register supplies an index into the table. The branch length is twice the value returned from the table.

T1

Byte variant

Applies when `H == 0`.

```
TBB{<c>}{<q>} [<Rn>, <Rm>] // Outside or last in IT block
```

Halfword variant

Applies when `H == 1`.

```
TBH{<c>}{<q>} [<Rn>, <Rm>, LSL #1] // Outside or last in IT block
```

Decode for all variants of this encoding

```
n = UInt(Rn);  m = UInt(Rm);  is_tbh = (H == '1');
if m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-3660.

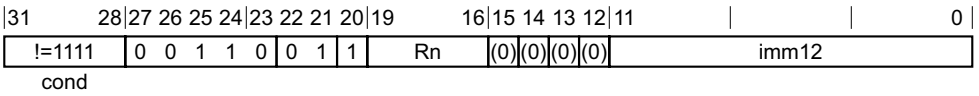
`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<Rn>` Is the general-purpose base register holding the address of the table of branch lengths, encoded in the "Rn" field. The PC can be used. If it is, the table immediately follows this instruction.

`<Rm>` For the byte variant: is the general-purpose index register, encoded in the "Rm" field. This register contains an integer pointing to a single byte in the table. The offset in the table is the value of the index.

For the halfword variant: is the general-purpose index register, encoded in the "Rm" field. This register contains an integer pointing to a halfword in the table. The offset in the table is twice the value of the index.

Operation



```
if ConditionPassed() then
    EncodingSpecificOperations();
    if is_tbh then
        halfwords = UInt(MemU[R[n]+LSL(R[m],1), 2]);
    else
        halfwords = UInt(MemU[R[n]+R[m], 1]);
    BranchWritePC(PC + 2*halfwords, BranchType_INDIR);
```

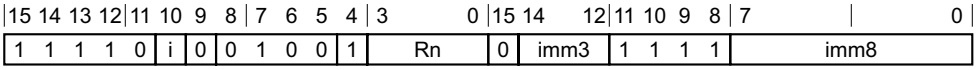
F5.1.257 TEQ (immediate)

Test Equivalence (immediate) performs a bitwise exclusive OR operation on a register value and an immediate value. It updates the condition flags based on the result, and discards the result.

A1



A1 variant

```
TEQ{<c>}{<q>} <Rn>, #<const>
```

Decode for this encoding

```
n = UInt(Rn);
(imm32, carry) = A32ExpandImm_C(imm12, PSTATE.C);
```

T1

T1 variant

```
TEQ{<c>}{<q>} <Rn>, #<const>
```

Decode for this encoding

```
n = UInt(Rn);
(imm32, carry) = T32ExpandImm_C(i:imm3:imm8, PSTATE.C);
if n == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<Rn> For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

For encoding T1: is the general-purpose source register, encoded in the "Rn" field.

<const> For encoding A1: an immediate value. See *Modified immediate constants in A32 instructions* on page F2-3676 for the range of values.

For encoding T1: an immediate value. See *Modified immediate constants in T32 instructions* on page F2-3675 for the range of values.

F5.1.258 TEQ (register)

Test Equivalence (register) performs a bitwise exclusive OR operation on a register value and an optionally-shifted register value. It updates the condition flags based on the result, and discards the result.

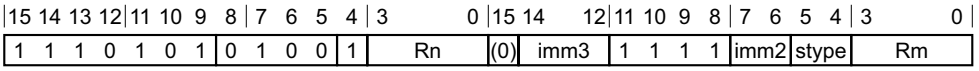
A1

Rotate right with extend variant

Applies when `imm5 == 00000 && stype == 11`.

```
TEQ{<c>}{<q>} <Rn>, <Rm>, RRX
```

Shift or rotate by value variant



Applies when `!(imm5 == 00000 && stype == 11)`.

```
TEQ{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = DecodeImmShift(stype, imm5);
```

T1

Rotate right with extend variant

Applies when `imm3 == 000 && imm2 == 00 && stype == 11`.

```
TEQ{<c>}{<q>} <Rn>, <Rm>, RRX
```

Shift or rotate by value variant

Applies when `!(imm3 == 000 && imm2 == 00 && stype == 11)`.

```
TEQ{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = DecodeImmShift(stype, imm3:imm2);
if n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<Rn> For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

For encoding T1: is the first general-purpose source register, encoded in the "Rn" field.

<Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T1: is the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values:

LSL when stype = 00

LSR when stype = 01

ASR when stype = 10

ROR when stype = 11

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

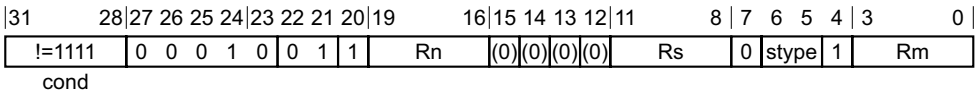
For encoding T1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] EOR shifted;
    PSTATE.N = result<31>;
    PSTATE.Z = IsZeroBit(result);
    PSTATE.C = carry;
    // PSTATE.V unchanged
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:



- The execution time of this instruction is independent of:

F5.1.259 TEQ (register-shifted register)

Test Equivalence (register-shifted register) performs a bitwise exclusive OR operation on a register value and a register-shifted register value. It updates the condition flags based on the result, and discards the result.

A1

A1 variant

```
TEQ{<c>}{<q>} <Rn>, <Rm>, <type> <Rs>
```

Decode for this encoding

```
n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
shift_t = DecodeRegShift(stype);
if n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<Rn> Is the first general-purpose source register, encoded in the "Rn" field.

<Rm> Is the second general-purpose source register, encoded in the "Rm" field.

<type> Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values:

- LSL when stype = 00
- LSR when stype = 01
- ASR when stype = 10
- ROR when stype = 11

<Rs> Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] EOR shifted;
    PSTATE.N = result<31>;
    PSTATE.Z = IsZeroBit(result);
    PSTATE.C = carry;
    // PSTATE.V unchanged
```

F5.1.260 TSB CSYNC

Trace Synchronization Barrier. This instruction is a barrier that synchronizes the trace operations of instructions.

If the Self-Hosted Trace Extension is not implemented, this instruction executes as a NOP.

A1

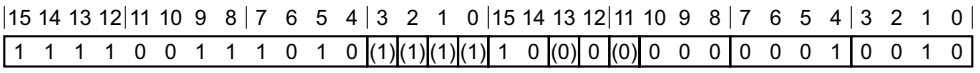
ARMv8.4

A1 variant

```
TSB{<c>}{<q>} CSYNC
```

Decode for this encoding

```
if !HaveSelfHostedTrace() then EndOfInstruction(); // Instruction executes as NOP
if cond != '1110' then UNPREDICTABLE;              // ESB must be encoded with AL condition
```



CONSTRAINED UNPREDICTABLE behavior

If `cond != '1110'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes unconditionally.
- The instruction executes conditionally.

T1

ARMv8.4

T1 variant

```
TSB{<c>}{<q>} CSYNC
```

Decode for this encoding

```
if !HaveSelfHostedTrace() then EndOfInstruction(); // Instruction executes as NOP
if InITBlock() then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes unconditionally.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

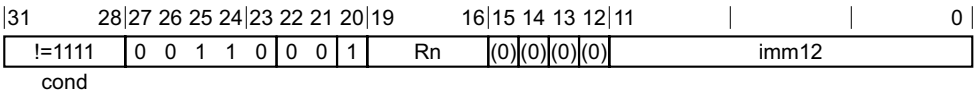
- The instruction executes conditionally.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

Operation for all encodings



```
if ConditionPassed() then
    EncodingSpecificOperations();
    TraceSynchronizationBarrier();
```

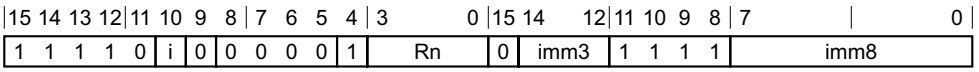
F5.1.261 TST (immediate)

Test (immediate) performs a bitwise AND operation on a register value and an immediate value. It updates the condition flags based on the result, and discards the result.

A1



A1 variant

```
TST{<c>}{<q>} <Rn>, #<const>
```

Decode for this encoding

```
n = UInt(Rn);
(imm32, carry) = A32ExpandImm_C(imm12, PSTATE.C);
```

T1

T1 variant

```
TST{<c>}{<q>} <Rn>, #<const>
```

Decode for this encoding

```
n = UInt(Rn);
(imm32, carry) = T32ExpandImm_C(i:imm3:imm8, PSTATE.C);
if n == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-3660.

F5.1.262 TST (register)

Test (register) performs a bitwise AND operation on a register value and an optionally-shifted register value. It updates the condition flags based on the result, and discards the result.

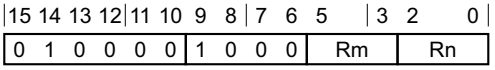
A1

Rotate right with extend variant

Applies when `imm5 == 00000 && stype == 11`.

```
TST{<c>}{<q>} <Rn>, <Rm>, RRX
```

Shift or rotate by value variant



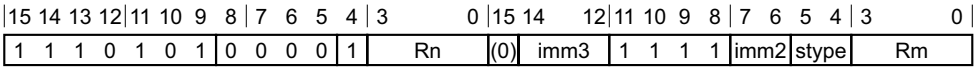
Applies when `!(imm5 == 00000 && stype == 11)`.

```
TST{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = DecodeImmShift(stype, imm5);
```

T1



T1 variant

```
TST{<c>}{<q>} <Rn>, <Rm>
```

Decode for this encoding

```
n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = (SRType_LSL, 0);
```

T2

Rotate right with extend variant

Applies when `imm3 == 000 && imm2 == 00 && stype == 11`.

```
TST{<c>}{<q>} <Rn>, <Rm>, RRX
```

Shift or rotate by value variant

Applies when `!(imm3 == 000 && imm2 == 00 && stype == 11)`.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

```
TST{<c>}.W <Rn>, <Rm> // <Rn>, <Rm> can be represented in T1
TST{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}
```

Decode for all variants of this encoding

```
n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = DecodeImmShift(stype, imm3:imm2);
if n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<Rn>` For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

For encoding T1 and T2: is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

`<shift>` Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values:

`LSL`	when `stype = 00`
`LSR`	when `stype = 01`
`ASR`	when `stype = 10`
`ROR`	when `stype = 11`

`<amount>` For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] AND shifted;
    PSTATE.N = result<31>;
    PSTATE.Z = IsZeroBit(result);
    PSTATE.C = carry;
    // PSTATE.V unchanged
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

F5.1.263 TST (register-shifted register)

Test (register-shifted register) performs a bitwise AND operation on a register value and a register-shifted register value. It updates the condition flags based on the result, and discards the result.

A1

A1 variant

```
TST{<c>}{<q>} <Rn>, <Rm>, <type> <Rs>
```

Decode for this encoding

```
n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
shift_t = DecodeRegShift(stype);
if n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<Rn>` Is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` Is the second general-purpose source register, encoded in the "Rm" field.

`<type>` Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values:

- `LSL` when `stype = 00`
- `LSR` when `stype = 01`
- `ASR` when `stype = 10`
- `ROR` when `stype = 11`

`<Rs>` Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] AND shifted;
    PSTATE.N = result<31>;
    PSTATE.Z = IsZeroBit(result);
    PSTATE.C = carry;
    // PSTATE.V unchanged
```

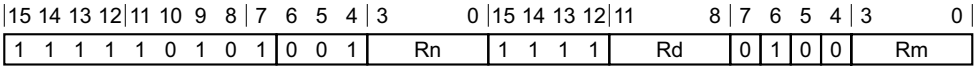
F5.1.264 UADD16

Unsigned Add 16 performs two 16-bit unsigned integer additions, and writes the results to the destination register. It sets PSTATE.GE according to the results of the additions.

A1



A1 variant

```
UADD16{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1

T1 variant

```
UADD16{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-3660.
<q>	See *Standard assembler syntax fields* on page F2-3660.
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register, encoded in the "Rm" field.

Operation for all encodings

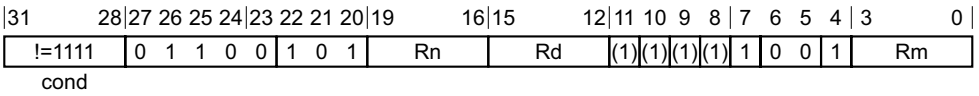
```
if ConditionPassed() then
    EncodingSpecificOperations();
    sum1 = UInt(R[n]<15:0>) + UInt(R[m]<15:0>);
    sum2 = UInt(R[n]<31:16>) + UInt(R[m]<31:16>);
    R[d]<15:0>  = sum1<15:0>;
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

```
R[d]<31:16> = sum2<15:0>;
PSTATE.GE<1:0> = if sum1 >= 0x10000 then '11' else '00';
PSTATE.GE<3:2> = if sum2 >= 0x10000 then '11' else '00';
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:



- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

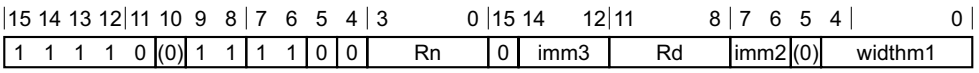
F5.1.267 UBFX

Unsigned Bit Field Extract extracts any number of adjacent bits at any position from a register, zero-extends them to 32 bits, and writes the result to the destination register.

A1



A1 variant

```
UBFX{<c>}{<q>} <Rd>, <Rn>, #<lsb>, #<width>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);
lsbit = UInt(lsb);  widthminus1 = UInt(widthm1);
if d == 15 || n == 15 then UNPREDICTABLE;
```

T1

T1 variant

```
UBFX{<c>}{<q>} <Rd>, <Rn>, #<lsb>, #<width>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);
lsbit = UInt(imm3:imm2);  widthminus1 = UInt(widthm1);
if d == 15 || n == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-3660.
<q>	See *Standard assembler syntax fields* on page F2-3660.
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the general-purpose source register, encoded in the "Rn" field.
<lsb>	For encoding A1: is the bit number of the least significant bit in the field, in the range 0 to 31, encoded in the "lsb" field. For encoding T1: is the bit number of the least significant bit in the field, in the range 0 to 31, encoded in the "imm3:imm2" field.
<width>	Is the width of the field, in the range 1 to 32-<lsb>, encoded in the "widthm1" field as <width>-1.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    msbit = lsbit + widthminus1;
    if msbit <= 31 then
        R[d] = ZeroExtend(R[n]<msbit:lsbit>, 32);
    else
        UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `msbit > 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The value in the destination register is UNKNOWN.

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

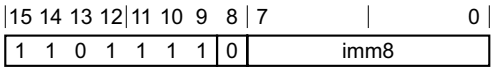
F5.1.268 UDF

Permanently Undefined generates an Undefined Instruction exception.

The encodings for UDF used in this section are defined as permanently UNDEFINED in the Armv8-A architecture. However:

- With the T32 instruction set, Arm deprecates using the UDF instruction in an IT block.
- In the A32 instruction set, UDF is not conditional.

A1



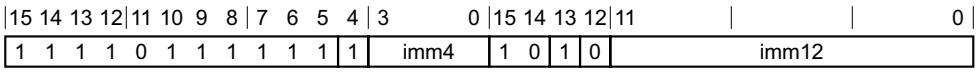
A1 variant

```
UDF{<c>}{<q>} {#}<imm>
```

Decode for this encoding

```
imm32 = ZeroExtend(imm12:imm4, 32);
// imm32 is for assembly and disassembly only, and is ignored by hardware.
```

T1



T1 variant

```
UDF{<c>}{<q>} {#}<imm>
```

Decode for this encoding

```
imm32 = ZeroExtend(imm8, 32);
// imm32 is for assembly and disassembly only, and is ignored by hardware.
```

T2

T2 variant

```
UDF{<c>}.W {#}<imm> // <imm> can be represented in T1
UDF{<c>}{<q>} {#}<imm>
```

Decode for this encoding

```
imm32 = ZeroExtend(imm4:imm12, 32);
// imm32 is for assembly and disassembly only, and is ignored by hardware.
```

Non-Confidential

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. <c> must be AL or omitted.

For encoding T1 and T2: see *Standard assembler syntax fields* on page F2-3660. Arm deprecates using any <c> value other than AL.

<q> See *Standard assembler syntax fields* on page F2-3660.

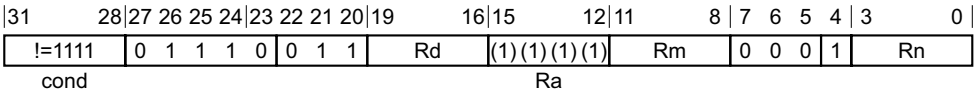
<imm> For encoding A1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm12:imm4" field. The PE ignores the value of this constant.

For encoding T1: is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field. The PE ignores the value of this constant.

For encoding T2: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm4:imm12" field. The PE ignores the value of this constant.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    UNDEFINED;
```



Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

F5.1.269 UDIV

Unsigned Divide divides a 32-bit unsigned integer register value by a 32-bit unsigned integer register value, and writes the result to the destination register. The condition flags are not affected.

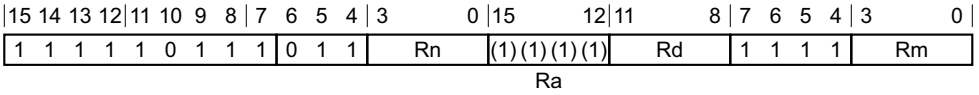
See *Divide instructions* on page F1-3629 for more information about this instruction.

A1

A1 variant

```
UDIV{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding



```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  a = UInt(Ra);
if d == 15 || n == 15 || m == 15 || a != 15 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `Ra != '1111'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction executes as described, with no change to its behavior and no additional side effects.
- The instruction performs a divide and the register specified by Ra becomes UNKNOWN.

T1

T1 variant

```
UDIV{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  a = UInt(Ra);
if d == 15 || n == 15 || m == 15 || a != 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If `Ra != '1111'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction executes as described, with no change to its behavior and no additional side effects.
- The instruction performs a divide and the register specified by Ra becomes UNKNOWN.

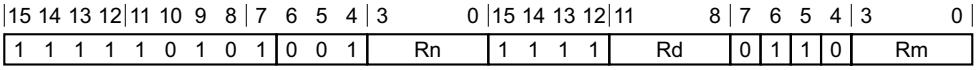
F5.1.270 UHADD16

Unsigned Halving Add 16 performs two unsigned 16-bit integer additions, halves the results, and writes the results to the destination register.

A1



A1 variant

```
UHADD16{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1

T1 variant

```
UHADD16{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-3660.

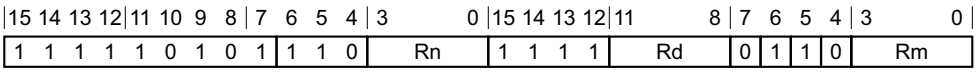
F5.1.273 UHSAX

Unsigned Halving Subtract and Add with Exchange exchanges the two halfwords of the second operand, performs one unsigned 16-bit integer subtraction and one unsigned 16-bit addition, halves the results, and writes the results to the destination register.

A1



A1 variant

```
UHSAX{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1

T1 variant

```
UHSAX{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<Rd> Is the general-purpose destination register, encoded in the "Rd" field.

<Rn> Is the first general-purpose source register, encoded in the "Rn" field.

<Rm> Is the second general-purpose source register, encoded in the "Rm" field.

Operation for all encodings

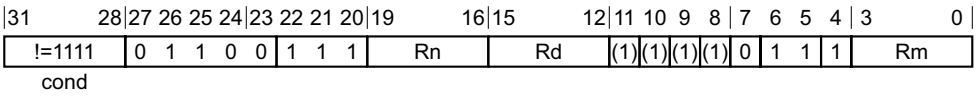
```
if ConditionPassed() then
    EncodingSpecificOperations();
    sum  = UInt(R[n]<15:0>) + UInt(R[m]<31:16>);
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

```
diff = UInt(R[n]<31:16>) - UInt(R[m]<15:0>);
R[d]<15:0>  = sum<16:1>;
R[d]<31:16> = diff<16:1>;
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:



- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

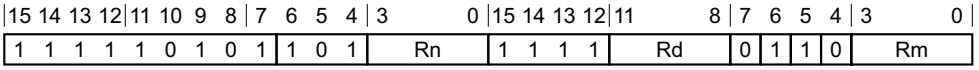
F5.1.274 UHSUB16

Unsigned Halving Subtract 16 performs two unsigned 16-bit integer subtractions, halves the results, and writes the results to the destination register.

A1



A1 variant

```
UHSUB16{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1

T1 variant

```
UHSUB16{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

F5.1.276 UMAAL

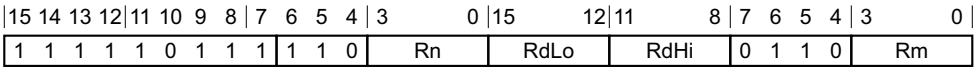
Unsigned Multiply Accumulate Accumulate Long multiplies two unsigned 32-bit values to produce a 64-bit value, adds two unsigned 32-bit values, and writes the 64-bit result to two registers.

A1

A1 variant

```
UMAAL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

Decode for this encoding



```
dLo = UInt(RdLo);  dHi = UInt(RdHi);  n = UInt(Rn);  m = UInt(Rm);
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if dHi == dLo then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `dHi == dLo`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The value in the destination register is UNKNOWN.

T1

T1 variant

```
UMAAL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

Decode for this encoding

```
dLo = UInt(RdLo);  dHi = UInt(RdHi);  n = UInt(Rn);  m = UInt(Rm);
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
// Armv8-A removes UNPREDICTABLE for R13
if dHi == dLo then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `dHi == dLo`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The value in the destination register is UNKNOWN.

F5.1.277 UMLAL, UMLALS

Unsigned Multiply Accumulate Long multiplies two unsigned 32-bit values to produce a 64-bit value, and accumulates this with a 64-bit value.

In A32 instructions, the condition flags can optionally be updated based on the result. Use of this option adversely affects performance on many implementations.

A1

Flag setting variant

Applies when `S == 1`.

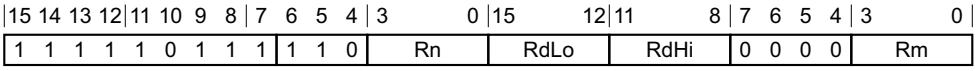
```
UMLALS{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

Not flag setting variant

Applies when `S == 0`.

```
UMLAL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

Decode for all variants of this encoding



```
dLo = UInt(RdLo);  dHi = UInt(RdHi);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if dHi == dLo then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `dHi == dLo`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The value in the destination register is UNKNOWN.

T1

T1 variant

```
UMLAL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

Decode for this encoding

```
dLo = UInt(RdLo);  dHi = UInt(RdHi);  n = UInt(Rn);  m = UInt(Rm);  setflags = FALSE;
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
// Armv8-A removes UNPREDICTABLE for R13
if dHi == dLo then UNPREDICTABLE;
```

F5.1.278 UMULL, UMULLS

Unsigned Multiply Long multiplies two 32-bit unsigned values to produce a 64-bit result.

In A32 instructions, the condition flags can optionally be updated based on the result. Use of this option adversely affects performance on many implementations.

A1

Flag setting variant

Applies when `S == 1`.

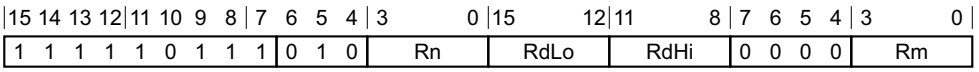
```
UMULLS{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

Not flag setting variant

Applies when `S == 0`.

```
UMULL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

Decode for all variants of this encoding



```
dLo = UInt(RdLo);  dHi = UInt(RdHi);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if dHi == dLo then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `dHi == dLo`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The value in the destination register is UNKNOWN.

T1

T1 variant

```
UMULL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

Decode for this encoding

```
dLo = UInt(RdLo);  dHi = UInt(RdHi);  n = UInt(Rn);  m = UInt(Rm);  setflags = FALSE;
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
// Armv8-A removes UNPREDICTABLE for R13
if dHi == dLo then UNPREDICTABLE;
```

F5.1.287 USAT

Unsigned Saturate saturates an optionally-shifted signed value to a selected unsigned range.

This instruction sets PSTATE.Q to 1 if the operation saturates.

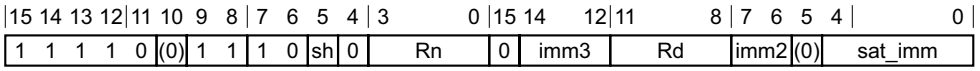
A1

Arithmetic shift right variant

Applies when `sh == 1`.

```
USAT{<c>}{<q>} <Rd>, #<imm>, <Rn>, ASR #<amount>
```

Logical shift left variant



Applies when `sh == 0`.

```
USAT{<c>}{<q>} <Rd>, #<imm>, <Rn> {, LSL #<amount>}
```

Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  saturate_to = UInt(sat_imm);
(shift_t, shift_n) = DecodeImmShift(sh:'0', imm5);
if d == 15 || n == 15 then UNPREDICTABLE;
```

T1

Arithmetic shift right variant

Applies when `sh == 1 && !(imm3 == 000 && imm2 == 00)`.

```
USAT{<c>}{<q>} <Rd>, #<imm>, <Rn>, ASR #<amount>
```

Logical shift left variant

Applies when `sh == 0`.

```
USAT{<c>}{<q>} <Rd>, #<imm>, <Rn> {, LSL #<amount>}
```

Decode for all variants of this encoding

```
if sh == '1' && (imm3:imm2) == '00000' then SEE "USAT16";
d = UInt(Rd);  n = UInt(Rn);  saturate_to = UInt(sat_imm);
(shift_t, shift_n) = DecodeImmShift(sh:'0', imm3:imm2);
if d == 15 || n == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.

`<imm>` Is the bit position for saturation, in the range 0 to 31, encoded in the "sat_imm" field.

`<Rn>` Is the general-purpose source register, encoded in the "Rn" field.

`<amount>` For encoding A1: is the optional shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm5" field.

For encoding A1: is the shift amount, in the range 1 to 32 encoded in the "imm5" field as <amount> modulo 32.

For encoding T1: is the optional shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm3:imm2" field.

For encoding T1: is the shift amount, in the range 1 to 31 encoded in the "imm3:imm2" field as <amount>.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    operand = Shift(R[n], shift_t, shift_n, PSTATE.C);  // PSTATE.C ignored
    (result, sat) = UnsignedSatQ(SInt(operand), saturate_to);
    R[d] = ZeroExtend(result, 32);
    if sat then
        PSTATE.Q = '1';
```

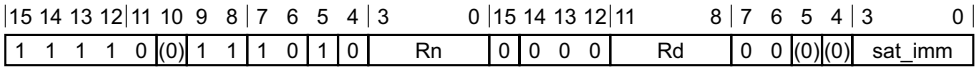
F5.1.288 USAT16

Unsigned Saturate 16 saturates two signed 16-bit values to a selected unsigned range.

This instruction sets PSTATE.Q to 1 if the operation saturates.

A1



A1 variant

```
USAT16{<c>}{<q>} <Rd>, #<imm>, <Rn>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  saturate_to = UInt(sat_imm);
if d == 15 || n == 15 then UNPREDICTABLE;
```

T1

T1 variant

```
USAT16{<c>}{<q>} <Rd>, #<imm>, <Rn>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  saturate_to = UInt(sat_imm);
if d == 15 || n == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-3660.
<q>	See *Standard assembler syntax fields* on page F2-3660.
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<imm>	Is the bit position for saturation, in the range 0 to 15, encoded in the "sat_imm" field.
<Rn>	Is the general-purpose source register, encoded in the "Rn" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (result1, sat1) = UnsignedSatQ(SInt(R[n]<15:0>), saturate_to);
    (result2, sat2) = UnsignedSatQ(SInt(R[n]<31:16>), saturate_to);

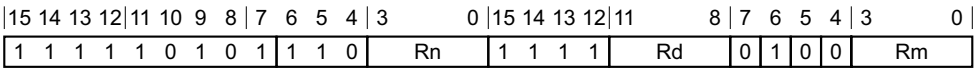
F5.1.289 USAX

Unsigned Subtract and Add with Exchange exchanges the two halfwords of the second operand, performs one unsigned 16-bit integer subtraction and one unsigned 16-bit addition, and writes the results to the destination register. It sets PSTATE.GE according to the results.

A1



A1 variant

```
USAX{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1

T1 variant

```
USAX{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

T1 variant

```
UXTAB16{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, ROR #<amount>}
```

Decode for this encoding

```
if Rn == '1111' then SEE "UXTB16";
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.

`<Rn>` Is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` Is the second general-purpose source register, encoded in the "Rm" field.

`<amount>` Is the rotate amount, encoded in the "rotate" field. It can have the following values:

`(omitted)` when `rotate = 00`

`8` when `rotate = 01`

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

16 when rotate = 10

24 when rotate = 11

Operation for all encodings

```
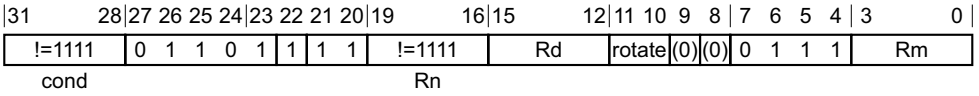
if ConditionPassed() then
    EncodingSpecificOperations();
    rotated = ROR(R[m], rotation);
    R[d]<15:0>  = R[n]<15:0> + ZeroExtend(rotated<7:0>, 16);
    R[d]<31:16> = R[n]<31:16> + ZeroExtend(rotated<23:16>, 16);
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:



- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

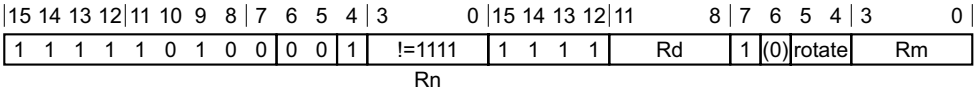
F5.1.294 UXTAH

Unsigned Extend and Add Halfword extracts a 16-bit value from a register, zero-extends it to 32 bits, adds the result to a value from another register, and writes the final result to the destination register. The instruction can specify a rotation by 0, 8, 16, or 24 bits before extracting the 16-bit value.

A1



A1 variant

```
UXTAH{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, ROR #<amount>}
```

Decode for this encoding

```
if Rn == '1111' then SEE "UXTH";
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE;
```

T1

T1 variant

```
UXTAH{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, ROR #<amount>}
```

Decode for this encoding

```
if Rn == '1111' then SEE "UXTH";
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

F5.1.298 WFE

Wait For Event is a hint instruction that indicates that the PE can enter a low-power state and remain there until a wakeup event occurs. Wakeup events include the event signaled as a result of executing the SEV instruction on any PE in the multiprocessor system. For more information, see *Wait For Event and Send Event* on page G1-5308.

As described in *Wait For Event and Send Event* on page G1-5308, the execution of a WFE instruction that would otherwise cause entry to a low-power state can be trapped to a higher Exception level, see:

- *Traps to Undefined mode of EL0 execution of WFE and WFI instructions* on page G1-5325.
- *Traps to Hyp mode of Non-secure EL0 and EL1 execution of WFE and WFI instructions* on page G1-5341.
- *Traps to Monitor mode of the execution of WFE and WFI instructions in modes other than Monitor mode* on page G1-5352.

F5.1.300 YIELD

YIELD is a hint instruction. Software with a multithreading capability can use a YIELD instruction to indicate to the PE that it is performing a task, for example a spin-lock, that could be swapped out to improve overall system performance. The PE can use this hint to suspend and resume multiple software threads if it supports the capability.

For more information about the recommended use of this instruction see *The Yield instruction* on page F1-3635.

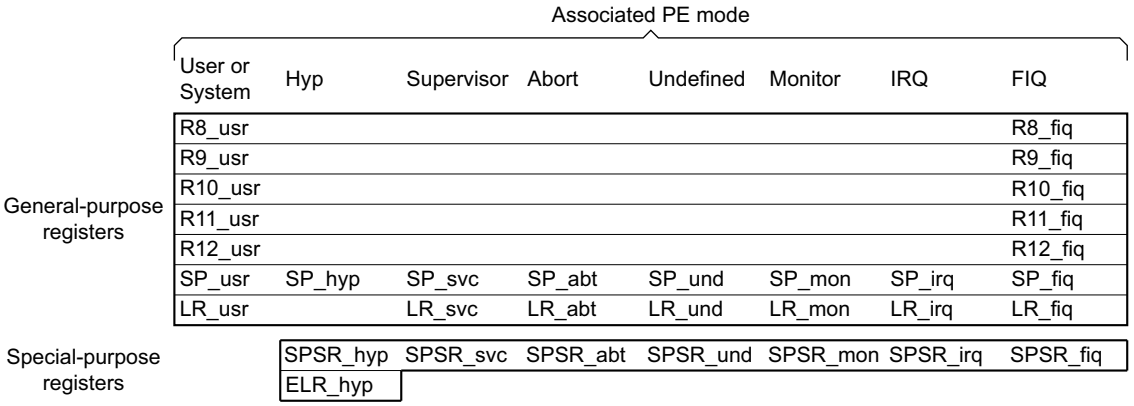
F5.2 Encoding and use of banked register transfer instructions



Software executing at EL1 or higher can use the MRS (banked register) and MSR (banked register) instructions to transfer values between the general-purpose registers and Special-purpose registers. One particular use of these instructions is for a hypervisor to save or restore the register values of a Guest OS. The following sections give more information about these instructions:

- *Register arguments in the banked register transfer instructions*.
- *Usage restrictions on the banked register transfer instructions* on page F5-4524.
- *Encoding the register argument in the banked register transfer instructions* on page F5-4525.
- *Pseudocode support for the banked register transfer instructions* on page F5-4526.

For descriptions of the instructions see *MRS (Banked register)* on page F5-4108 and *MSR (Banked register)* on page F5-4112.

F5.2.1 Register arguments in the banked register transfer instructions

Figure F5-1 shows the banked general-purpose registers and Special-purpose registers:

For the general-purpose registers, if no other register is shown, the *current mode register* is the _usr register. So, for example, the full set of current mode registers, including the registers that are not banked:

- For Hyp mode, is {R0_usr - R12_usr, SP_hyp, LR_usr, SPSR_hyp, ELR_hyp}.
- For Abort mode, is {R0_usr - R12_usr, SP_abt, LR_abt, SPSR_abt}.

Figure F5-1 Banking of general-purpose and Special-purpose registers

Figure F5-1 is based on Figure G1-2 on page G1-5233, that shows the complete set of general-purpose registers and Special-purpose registers accessible in each mode.

Note

- System mode uses the same set of registers as User mode. Neither of these modes can access an SPSR, except that System mode can use the MRS (banked register) and MSR (banked register) instructions to access some SPSRs, as described in *Usage restrictions on the banked register transfer instructions* on page F5-4524.
- General-purpose registers R0-R7, that are not banked, cannot be accessed using the MRS (banked register) and MSR (banked register) instructions.
- In addition to the registers shown in Figure F5-1, the DLR and DSPSR are AArch32 System registers that map onto the AArch64 Special-purpose registers DLR_EL0 and DSPSR_EL0. However, DLR and DSPSR are not accessible using the MRS (banked register) and MSR (banked register) instructions.

Software using an MRS (banked register) or MSR (banked register) instruction specifies one of these registers using a name shown in Figure F5-1, or an alternative name for SP or LR. These registers can be grouped as follows:

R8-R12 Each of these registers has two banked copies, _usr and _fiq, for example R8_usr and R8_fiq.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

SP There is a banked copy of SP for every mode except System mode. For example, SP_svc is the SP for Supervisor mode.

LR There is a banked copy of LR for every mode except System mode and Hyp mode. For example, LR_svc is the LR for Supervisor mode.

SPSR There is a banked copy of SPSR for every mode except System mode and User mode.

ELR_hyp Except for the operations provided by MRS (banked register) and MSR (banked register), ELR_hyp is accessible only from Hyp mode. It is not banked.

F5.2.2 Usage restrictions on the banked register transfer instructions

MRS (banked register) and MSR (banked register) instructions are CONSTRAINED UNPREDICTABLE if any of the following applies:

- The instruction is executed in User mode.
- The instruction accesses a banked register that is not implemented, or that either:
  - Is not accessible from the current Privilege level and Security state.
  - Can be accessed from the current mode by using a different instruction.

MSR (banked register) and MRS (banked register) on page K1-7212 describes the permitted CONSTRAINED UNPREDICTABLE behavior.

An MRS (banked register) instruction or an MSR (banked register) instruction executed:

- At Non-secure EL1 cannot access any Hyp mode banked registers.
- At Non-secure EL1 or EL2 cannot access any Monitor mode banked registers.
- In a Secure mode other than Monitor mode cannot access any Hyp banked registers.

This means that the banked registers that MRS (banked register) and MSR (banked register) instructions cannot access are:

From Monitor mode

- The current mode registers R8_usr-R12_usr, SP_mon, LR_mon, and SPSR_mon.

From Hyp mode

- The Monitor mode registers SP_mon, LR_mon, and SPSR_mon.
- The current mode registers R8_usr-R12_usr, SP_hyp, LR_usr, and SPSR_hyp.

Note

MRS (banked register) and MSR (banked register) instructions can access the current mode register ELR_hyp.

From FIQ mode

- From Non-secure EL1, the Monitor mode registers SP_mon, LR_mon, and SPSR_mon.
- The Hyp mode registers SP_hyp, SPSR_hyp, and ELR_hyp.
- The current mode registers R8_fiq-R12_fiq, SP_fiq, LR_fiq, and SPSR_fiq.

From System mode

- From Non-secure EL1, the Monitor mode registers SP_mon, LR_mon, and SPSR_mon.
- The Hyp mode registers SP_hyp, SPSR_hyp, and ELR_hyp.
- The current mode registers R8_usr-R12_usr, SP_usr, and LR_usr.

From Supervisor mode, Abort mode, Undefined mode, and IRQ mode

- From Non-secure EL1, the Monitor mode registers SP_mon, LR_mon, and SPSR_mon.
- The Hyp mode registers SP_hyp, SPSR_hyp, and ELR_hyp.
- The current mode registers R8_usr-R12_usr, SP_<current_mode>, LR_<current_mode>, and SPSR_<current_mode>.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

If EL3 is using AArch64, all MRS (banked register) and MSR (banked register) accesses to the Monitor mode registers from Secure EL1 modes are trapped to EL3. See *Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32* on page D1-2231.

For more information, see:

- *Encoding the register argument in the banked register transfer instructions*.
- *Pseudocode support for the banked register transfer instructions* on page F5-4526.
- *MRS (Banked register)* on page F5-4108.
- *MSR (Banked register)* on page F5-4112.

Note

CONSTRAINED UNPREDICTABLE behavior must not give access to registers that are not accessible from the current Privilege level and Security state.

F5.2.3 Encoding the register argument in the banked register transfer instructions

The MRS (banked register) and MSR (banked register) instructions include a 5-bit field, SYSm, and an R bit, that together encode the register argument for the instruction.

When the R bit is set to 0, the argument is a register other than a banked copy of the SPSR, and Table F5-1 shows how the SYSm field defines the required register argument. In this table, CONST. UNPREDICTABLE indicates that behavior is CONSTRAINED UNPREDICTABLE.

Table F5-1 Banked register encodings when R==0

SYSm<2:0>	SYSm<4:3>			
	0b00	0b01	0b10	0b11
0b000	R8_usr	R8_fiq	LR_irq	CONST. UNPREDICTABLE
0b001	R9_usr	R9_fiq	SP_irq	CONST. UNPREDICTABLE
0b010	R10_usr	R10_fiq	LR_svc	CONST. UNPREDICTABLE

F5.2.4 Pseudocode support for the banked register transfer instructions

The pseudocode functions `BankedRegisterAccessValid()` and `SPSRaccessValid()` check the validity of `MRS` (banked register) and `MSR` (banked register) accesses. That is, they filter the accesses that are CONSTRAINED UNPREDICTABLE either because:

- They attempt to access a register that *Usage restrictions on the banked register transfer instructions* on page F5-4524 shows is not accessible.
- They use an `SYSm<4:0>` encoding that *Encoding the register argument in the banked register transfer instructions* on page F5-4525 shows as CONSTRAINED UNPREDICTABLE.

`BankedRegisterAccessValid()` applies to accesses to the banked general-purpose registers, or to ELR_hyp, and `SPSRaccessValid()` applies to accesses to the SPSRs.

Chapter F6
T32 and A32 Advanced SIMD and Floating-point Instruction Descriptions

This chapter describes each instruction. It contains the following sections:

- *Alphabetical list of Advanced SIMD and floating-point instructions* on page F6-4528.

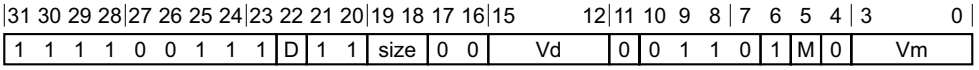
Note

Some headings in this chapter use the term *floating-point register*. This is an abbreviated description, and means a register in the Advanced SIMD and floating-point register file.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

F6.1 Alphabetical list of Advanced SIMD and floating-point instructions

This section lists every Advanced SIMD and floating-point instruction in the T32 and A32 instruction sets. For details of the format used see *Format of instruction descriptions* on page F2-3656.



This section is formatted so that each instruction description starts on a new page.

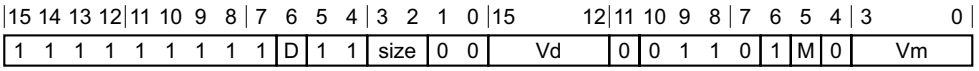
F6.1.1 AESD

AES single round decryption.

A1



A1 variant

```
AESD.<dt> <Qd>, <Qm>
```

Decode for this encoding

```
if !HaveAESExt() then UNDEFINED;
if size != '00' then UNDEFINED;
if Vd<0> == '1' || Vm<0> == '1' then UNDEFINED;
d = UInt(D:Vd); m = UInt(M:Vm);
```

T1

T1 variant

```
AESD.<dt> <Qd>, <Qm>
```

Decode for this encoding

```
if InITBlock() then UNPREDICTABLE;
if !HaveAESExt() then UNDEFINED;
if size != '00' then UNDEFINED;
if Vd<0> == '1' || Vm<0> == '1' then UNDEFINED;
d = UInt(D:Vd); m = UInt(M:Vm);
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<dt> Is the data type, encoded in the "size" field. It can have the following values:

8 when `size = 00`

The following encodings are reserved:

- `size = 01`.
- `size = 1x`.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

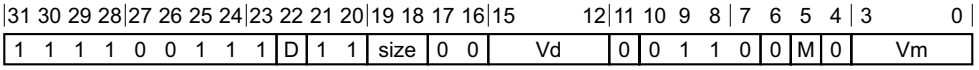
Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckCryptoEnabled32();
    op1 = Q[d>>1]; op2 = Q[m>>1];
    Q[d>>1] = AESInvSubBytes(AESInvShiftRows(op1 EOR op2));
```

Operational information

If CPSR.DIT is 1:



- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

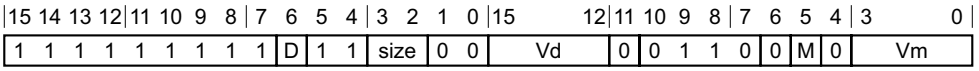
Non-Confidential

F6.1.2 AESE

AES single round encryption.

A1



A1 variant

```
AESE.<dt> <Qd>, <Qm>
```

Decode for this encoding

```
if !HaveAESExt() then UNDEFINED;
if size != '00' then UNDEFINED;
if Vd<0> == '1' || Vm<0> == '1' then UNDEFINED;
d = UInt(D:Vd); m = UInt(M:Vm);
```

T1

T1 variant

```
AESE.<dt> <Qd>, <Qm>
```

Decode for this encoding

```
if InITBlock() then UNPREDICTABLE;
if !HaveAESExt() then UNDEFINED;
if size != '00' then UNDEFINED;
if Vd<0> == '1' || Vm<0> == '1' then UNDEFINED;
d = UInt(D:Vd); m = UInt(M:Vm);
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<dt> Is the data type, encoded in the "size" field. It can have the following values:

8 when `size = 00`

The following encodings are reserved:

- `size = 01`.
- `size = 1x`.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

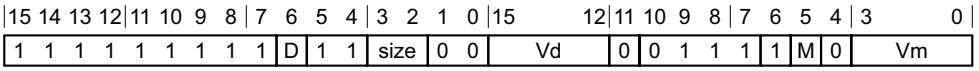
F6.1.3 AESIMC

AES inverse mix columns.

A1



A1 variant

```
AESIMC.<dt> <Qd>, <Qm>
```

Decode for this encoding

```
if !HaveAESExt() then UNDEFINED;
if size != '00' then UNDEFINED;
if Vd<0> == '1' || Vm<0> == '1' then UNDEFINED;
d = UInt(D:Vd); m = UInt(M:Vm);
```

T1

T1 variant

```
AESIMC.<dt> <Qd>, <Qm>
```

Decode for this encoding

```
if InITBlock() then UNPREDICTABLE;
if !HaveAESExt() then UNDEFINED;
if size != '00' then UNDEFINED;
if Vd<0> == '1' || Vm<0> == '1' then UNDEFINED;
d = UInt(D:Vd); m = UInt(M:Vm);
```

Assembler symbols

<dt> Is the data type, encoded in the "size" field. It can have the following values:

8 when `size = 00`

The following encodings are reserved:

- `size = 01`.
- `size = 1x`.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckCryptoEnabled32();
    Q[d>>1] = AESInvMixColumns(Q[m>>1]);
```

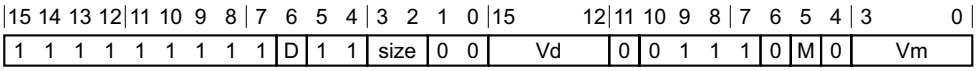
F6.1.4 AESMC

AES mix columns.

A1



A1 variant

```
AESMC.<dt> <Qd>, <Qm>
```

Decode for this encoding

```
if !HaveAESExt() then UNDEFINED;
if size != '00' then UNDEFINED;
if Vd<0> == '1' || Vm<0> == '1' then UNDEFINED;
d = UInt(D:Vd); m = UInt(M:Vm);
```

T1

T1 variant

```
AESMC.<dt> <Qd>, <Qm>
```

Decode for this encoding

```
if InITBlock() then UNPREDICTABLE;
if !HaveAESExt() then UNDEFINED;
if size != '00' then UNDEFINED;
if Vd<0> == '1' || Vm<0> == '1' then UNDEFINED;
d = UInt(D:Vd); m = UInt(M:Vm);
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<dt> Is the data type, encoded in the "size" field. It can have the following values:

8 when `size = 00`

The following encodings are reserved:

F6.1.5 FLDM*X (FLDMDBX, FLDMIAX)

FLDMDBX is the Decrement Before variant of this instruction, and FLDMIAX is the Increment After variant. FLDM*X loads multiple SIMD&FP registers from consecutive locations in the Advanced SIMD and floating-point register file using an address from a general-purpose register.

Arm deprecates use of FLDMDBX and FLDMIAX, except for disassembly purposes, and reassembly of disassembled code.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1

Decrement Before variant

Applies when `P == 1 && U == 0 && W == 1`.

```
FLDMDBX{<c>}{<q>} <Rn>!, <dreglist>
```

Increment After variant

Applies when `P == 0 && U == 1`.

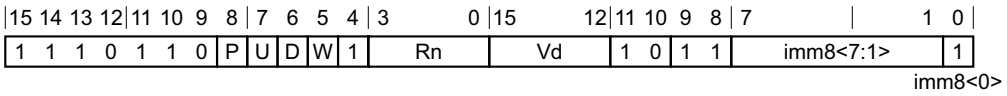
```
FLDMIAX{<c>}{<q>} <Rn>{!}, <dreglist>
```

Decode for all variants of this encoding

```
if P == '0' && U == '0' && W == '0' then SEE "Related encodings";
if P == '1' && W == '0' then SEE "VLDR";
if P == U && W == '1' then UNDEFINED;
// Remaining combinations are PUW = 010 (IA without !), 011 (IA with !), 101 (DB with !)
single_regs = FALSE;  add = (U == '1');  wback = (W == '1');
d = UInt(D:Vd);  n = UInt(Rn);  imm32 = ZeroExtend(imm8:'00', 32);
regs = UInt(imm8) DIV 2;  // If UInt(imm8) is odd, see "FLDM*X".
if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
if regs == 0 || regs > 16 || (d+regs) > 32 then UNPREDICTABLE;
if imm8<0> == '1' && (d+regs) > 16 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `regs == 0`, then one of the following behaviors must occur:



- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction operates as a `VLDM` with the same addressing mode but loads no registers.

If `regs > 16 || (d+regs) > 16`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

T1

Decrement Before variant

Applies when `P == 1 && U == 0 && W == 1`.

```
FLDMDBX{<c>}{<q>} <Rn>!, <dreglist>
```

Increment After variant

Applies when `P == 0 && U == 1`.

```
FLDMIAX{<c>}{<q>} <Rn>{!}, <dreglist>
```

Decode for all variants of this encoding

```
if P == '0' && U == '0' && W == '0' then SEE "Related encodings";
if P == '1' && W == '0' then SEE "VLDR";
if P == U && W == '1' then UNDEFINED;
// Remaining combinations are PUW = 010 (IA without !), 011 (IA with !), 101 (DB with !)
single_regs = FALSE;  add = (U == '1');  wback = (W == '1');
d = UInt(D:Vd);  n = UInt(Rn);  imm32 = ZeroExtend(imm8:'00', 32);
regs = UInt(imm8) DIV 2;  // If UInt(imm8) is odd, see "FLDM*X".
if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
if regs == 0 || regs > 16 || (d+regs) > 32 then UNPREDICTABLE;
if imm8<0> == '1' && (d+regs) > 16 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `regs == 0`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction operates as a `VLDM` with the same addressing mode but loads no registers.

If `regs > 16 || (d+regs) > 16`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Related encodings: See *Advanced SIMD and floating-point 64-bit move* on page F3-3723 for the T32 instruction set, or *Advanced SIMD and floating-point 64-bit move* on page F4-3794 for the A32 instruction set.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<Rn> Is the general-purpose base register, encoded in the "Rn" field. If writeback is not specified, the PC can be used.

! Specifies base register writeback. Encoded in the "W" field as 1 if present, otherwise 0.

<dreglist> Is the list of consecutively numbered 64-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "D:Vd", and "imm8" is set to twice the number of registers in the list plus one. The list must contain at least one register, all registers must be in the range D0-D15, and must not contain more than 16 registers.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckVFPEnabled(TRUE);
    address = if add then R[n] else R[n]-imm32;
    for r = 0 to regs-1
        if single_regs then
            S[d+r] = MemA[address,4];  address = address+4;
        else
            word1 = MemA[address,4];  word2 = MemA[address+4,4];  address = address+8;
            // Combine the word-aligned words in the correct order for current endianness.
            D[d+r] = if BigEndian() then word1:word2 else word2:word1;
    if wback then R[n] = if add then R[n]+imm32 else R[n]-imm32;
```

F6.1.6 FSTMDBX, FSTMIAX

FSTMX stores multiple SIMD&FP registers from the Advanced SIMD and floating-point register file to consecutive locations in using an address from a general-purpose register.

Arm deprecates use of FLDMDBX and FLDMIAX, except for disassembly purposes, and reassembly of disassembled code.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1

Decrement Before variant

Applies when `P == 1 && U == 0 && W == 1`.

```
FSTMDBX{<c>}{<q>} <Rn>!, <dreglist>
```

Increment After variant

Applies when `P == 0 && U == 1`.

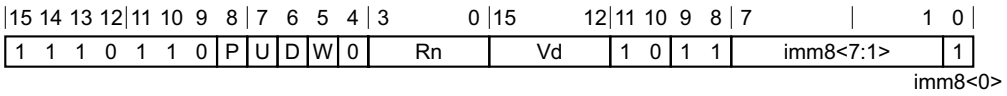
```
FSTMIAX{<c>}{<q>} <Rn>{!}, <dreglist>
```

Decode for all variants of this encoding

```
if P == '0' && U == '0' && W == '0' then SEE "Related encodings";
if P == '1' && W == '0' then SEE "VSTR";
if P == U && W == '1' then UNDEFINED;
// Remaining combinations are PUW = 010 (IA without !), 011 (IA with !), 101 (DB with !)
single_regs = FALSE;  add = (U == '1');  wback = (W == '1');
d = UInt(D:Vd);  n = UInt(Rn);  imm32 = ZeroExtend(imm8:'00', 32);
regs = UInt(imm8) DIV 2;  // If UInt(imm8) is odd, see "FSTMX".
if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
if regs == 0 || regs > 16 || (d+regs) > 32 then UNPREDICTABLE;
if imm8<0> == '1' && (d+regs) > 16 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `regs == 0`, then one of the following behaviors must occur:



- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction operates as a `VSTM` with the same addressing mode but stores no registers.

If `regs > 16 || (d+regs) > 16`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

if Q != '1' then UNDEFINED;
if Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1' then UNDEFINED;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckCryptoEnabled32();
    X = Q[d>>1];
    Y = Q[n>>1]<31:0>; // Note: 32 bits wide
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

```
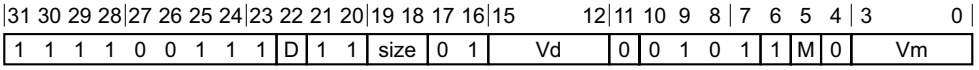
W = Q[m>>1];
for e = 0 to 3
    t = SHAchoose(X<63:32>, X<95:64>, X<127:96>);
    Y = Y + ROL(X<31:0>, 5) + t + Elem[W, e, 32];
    X<63:32> = ROL(X<63:32>, 30);
    <Y, X> = ROL(Y:X, 32);
Q[d>>1] = X;
```

Operational information

If CPSR.DIT is 1:



- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

F6.1.17 VABA

Vector Absolute Difference and Accumulate subtracts the elements of one vector from the corresponding elements of another vector, and accumulates the absolute values of the results into the elements of the destination vector.

Operand and result elements are all integers of the same length.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

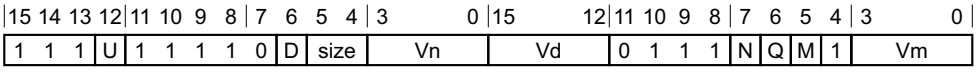
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VABA{<c>}{<q>}.<dt> <Dd>, <Dn>, <Dm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VABA{<c>}{<q>}.<dt> <Qd>, <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if size == '11' then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
unsigned = (U == '1');  long_destination = FALSE;
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VABA{<c>}{<q>}.<dt> <Dd>, <Dn>, <Dm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VABA{<c>}{<q>}.<dt> <Qd>, <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if size == '11' then UNDEFINED;

F6.1.18 VABAL

Vector Absolute Difference and Accumulate Long subtracts the elements of one vector from the corresponding elements of another vector, and accumulates the absolute values of the results into the elements of the destination vector.

Operand elements are all integers of the same length, and the result elements are double the length of the operands.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1

F6.1.19 VABD (floating-point)

Vector Absolute Difference (floating-point) subtracts the elements of one vector from the corresponding elements of another vector, and places the absolute values of the results in the elements of the destination vector.

Operand and result elements are floating-point numbers of the same size.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

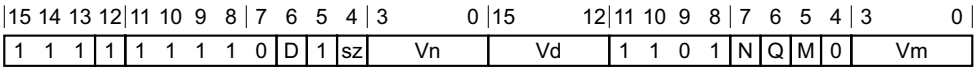
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VABD{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VABD{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
case sz of
    when '0' esize = 32; elements = 2;
    when '1' esize = 16; elements = 4;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VABD{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VABD{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
if sz == '1' && InITBlock() then UNPREDICTABLE;
case sz of
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

```
    when '0' esize = 32; elements = 2;
    when '1' esize = 16; elements = 4;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

CONSTRAINED UNPREDICTABLE behavior

If `sz == '1' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

```

Decode for all variants of this encoding

```
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
if size == '01' && InITBlock()  then UNPREDICTABLE;
advsimd = FALSE;
case size of
    when '01' esize = 16; d = UInt(Vd:D); m = UInt(Vm:M);
    when '10' esize = 32; d = UInt(Vd:D); m = UInt(Vm:M);
    when '11' esize = 64; d = UInt(D:Vd); m = UInt(M:Vm);
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding A2, T1 and T2: see *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<dt> Is the data type for the elements of the vectors, encoded in the "F:size" field. It can have the following values:

`S8` when `F = 0, size = 00`

`S16` when `F = 0, size = 01`

`S32` when `F = 0, size = 10`

`F16` when `F = 1, size = 01`

`F32` when `F = 1, size = 10`

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

<Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.

<Sm> Is the 32-bit name of the SIMD&FP source register, encoded in the "Vm:M" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDOrVFPEnabled(TRUE, advsimd);
    if advsimd then  // Advanced SIMD instruction
        for r = 0 to regs-1
            for e = 0 to elements-1
                if floating_point then
                    Elem[D[d+r],e,esize] = FPAbs(Elem[D[m+r],e,esize]);
                else
                    result = Abs(SInt(Elem[D[m+r],e,esize]));
                    Elem[D[d+r],e,esize] = result<esize-1:0>;
    else             // VFP instruction
        case esize of
            when 16 S[d] = Zeros(16) : FPAbs(S[m]<15:0>);
            when 32 S[d] = FPAbs(S[m]);
            when 64 D[d] = FPAbs(D[m]);
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

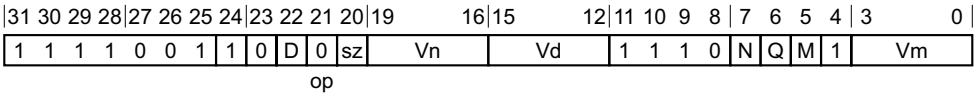
F6.1.23 VACGE

Vector Absolute Compare Greater Than or Equal takes the absolute value of each element in a vector, and compares it with the absolute value of the corresponding element of a second vector. If the first is greater than or equal to the second, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.



The operands and result can be quadword or doubleword vectors. They must all be the same size.

The operand vector elements are floating-point numbers. The result vector elements are the same size as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

This instruction is used by the pseudo-instruction VACLE. The pseudo-instruction is never the preferred disassembly.

A1

64-bit SIMD vector variant

F6.1.24 VACLE

Vector Absolute Compare Less Than or Equal takes the absolute value of each element in a vector, and compares it with the absolute value of the corresponding element of a second vector. If the first is less than or equal to the second, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros

This instruction is a pseudo-instruction of the VACGE instruction. This means that:

- The encodings in this description are named to match the encodings of VACGE.
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VACGE gives the operational pseudocode for this instruction.

A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VACLE{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

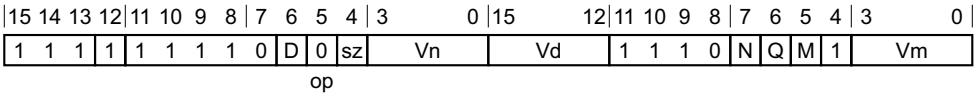
is equivalent to

```
VACGE{<c>}{<q>}.<dt> <Dd>, <Dm>, <Dn>
```

and is never the preferred disassembly.

128-bit SIMD vector variant

Applies when `Q == 1`.



```
VACLE{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>
```

is equivalent to

```
VACGE{<c>}{<q>}.<dt> <Qd>, <Qm>, <Qn>
```

and is never the preferred disassembly.

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VACLE{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

is equivalent to

```
VACGE{<c>}{<q>}.<dt> <Dd>, <Dm>, <Dn>
```

and is never the preferred disassembly.

F6.1.27 VADD (floating-point)

Vector Add (floating-point) adds corresponding elements in two vectors, and places the results in the destination vector.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

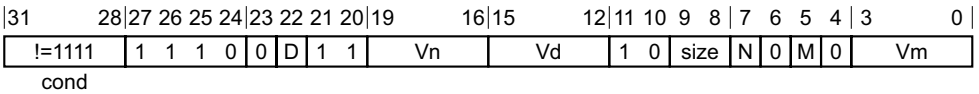
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VADD{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VADD{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
advsimd = TRUE;
case sz of
    when '0' esize = 32; elements = 2;
    when '1' esize = 16; elements = 4;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

A2

Half-precision scalar variant

Applies when `size == 01`.

```
VADD{<c>}{<q>}.F16 {<Sd>,} <Sn>, <Sm>
```

Single-precision scalar variant

Applies when `size == 10`.

```
VADD{<c>}{<q>}.F32 {<Sd>,} <Sn>, <Sm>
```

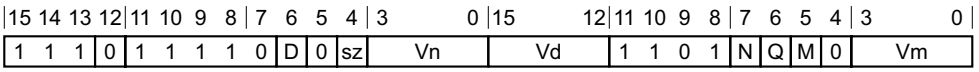
Double-precision scalar variant

Applies when `size == 11`.

```
VADD{<c>}{<q>}.F64 {<Dd>,} <Dn>, <Dm>
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Decode for all variants of this encoding



```
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
if size == '01' && cond != '1110' then UNPREDICTABLE;
advsimd = FALSE;
case size of
    when '01' esize = 16; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
    when '10' esize = 32; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
    when '11' esize = 64; d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && cond != '1110'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

T2

Half-precision scalar variant

Applies when `size == 01`.

```
VADD{<c>}{<q>}.F16 {<Sd>,} <Sn>, <Sm>
```

Single-precision scalar variant

Applies when `size == 10`.

```
VADD{<c>}{<q>}.F32 {<Sd>,} <Sn>, <Sm>
```

Double-precision scalar variant

Applies when `size == 11`.

```
VADD{<c>}{<q>}.F64 {<Dd>,} <Dn>, <Dm>
```

Decode for all variants of this encoding

```
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
if size == '01' && InITBlock()  then UNPREDICTABLE;
advsimd = FALSE;
case size of
    when '01' esize = 16; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
    when '10' esize = 32; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
    when '11' esize = 64; d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

`<c>` For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding A2, T1 and T2: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<dt>` Is the data type for the elements of the vectors, encoded in the "sz" field. It can have the following values:

`F32` when `sz = 0`

`F16` when `sz = 1`

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Qn>` Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

<Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.

<Sn> Is the 32-bit name of the first SIMD&FP source register, encoded in the "Vn:N" field.

<Sm> Is the 32-bit name of the second SIMD&FP source register, encoded in the "Vm:M" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDOrVFPEnabled(TRUE, advsimd);
    if advsimd then  // Advanced SIMD instruction
        for r = 0 to regs-1
            for e = 0 to elements-1
                Elem[D[d+r],e,esize] = FPAdd(Elem[D[n+r],e,esize], Elem[D[m+r],e,esize],
                                             StandardFPSCRValue());
    else             // VFP instruction
        case esize of
            when 16
                S[d] = Zeros(16) : FPAdd(S[n]<15:0>, S[m]<15:0>, FPSCR);
            when 32
                S[d] = FPAdd(S[n], S[m], FPSCR);
            when 64
                D[d] = FPAdd(D[n], D[m], FPSCR);
```

F6.1.28 VADD (integer)

Vector Add (integer) adds corresponding elements in two vectors, and places the results in the destination vector.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

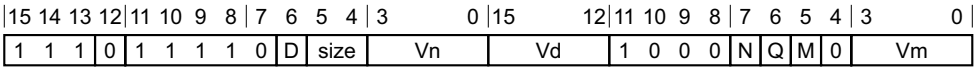
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VADD{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VADD{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VADD{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VADD{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<dt>` Is the data type for the elements of the vectors, encoded in the "size" field. It can have the following values:

`I8` when `size = 00`

`I16` when `size = 01`

`I32` when `size = 10`

`I64` when `size = 11`

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Qn>` Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

`<Qm>` Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

`<Dn>` Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

`<Dm>` Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            Elem[D[d+r],e,esize] = Elem[D[n+r],e,esize] + Elem[D[m+r],e,esize];
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

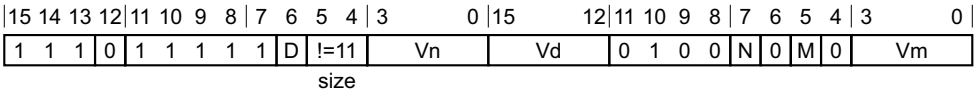
F6.1.29 VADDHN

Vector Add and Narrow, returning High Half adds corresponding elements in two quadword vectors, and places the most significant half of each result in a doubleword vector. The results are truncated. For rounded results, see VRADDHN.

The operand elements can be 16-bit, 32-bit, or 64-bit integers. There is no distinction between signed and unsigned integers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1



A1 variant

```
VADDHN{<c>}{<q>}.<dt> <Dd>, <Qn>, <Qm>
```

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
if Vn<0> == '1' || Vm<0> == '1' then UNDEFINED;
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);
```

T1

T1 variant

```
VADDHN{<c>}{<q>}.<dt> <Dd>, <Qn>, <Qm>
```

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
if Vn<0> == '1' || Vm<0> == '1' then UNDEFINED;
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);
```

Notes for all encodings

Related encodings: See *Advanced SIMD data-processing* on page F3-3713 for the T32 instruction set, or *Advanced SIMD data-processing* on page F4-3799 for the A32 instruction set.

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<dt> Is the data type for the elements of the operands, encoded in the "size" field. It can have the following values:

I16 when size = 00

I32 when size = 01

I64 when size = 10

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for e = 0 to elements-1
        result = Elem[Qin[n>>1],e,2*esize] + Elem[Qin[m>>1],e,2*esize];
        Elem[D[d],e,esize] = result<2*esize-1:esize>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

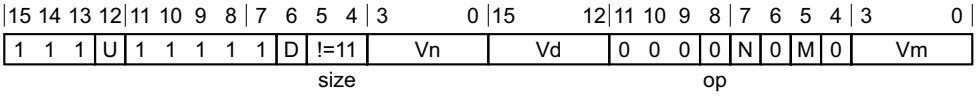
F6.1.30 VADDL

Vector Add Long adds corresponding elements in two doubleword vectors, and places the results in a quadword vector. Before adding, it sign-extends or zero-extends the elements of both operands.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1



A1 variant

```
VADDL{<c>}{<q>}.<dt> <Qd>, <Dn>, <Dm>
```

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
if Vd<0> == '1' || (op == '1' && Vn<0> == '1') then UNDEFINED;
unsigned = (U == '1');
esize = 8 << UInt(size);  elements = 64 DIV esize;  is_vaddw = (op == '1');
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);
```

T1

T1 variant

```
VADDL{<c>}{<q>}.<dt> <Qd>, <Dn>, <Dm>
```

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
if Vd<0> == '1' || (op == '1' && Vn<0> == '1') then UNDEFINED;
unsigned = (U == '1');
esize = 8 << UInt(size);  elements = 64 DIV esize;  is_vaddw = (op == '1');
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);
```

Notes for all encodings

Related encodings: See *Advanced SIMD data-processing* on page F3-3713 for the T32 instruction set, or *Advanced SIMD data-processing* on page F4-3799 for the A32 instruction set.

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

F6.1.32 VAND (immediate)

Vector Bitwise AND (immediate) performs a bitwise AND between a register value and an immediate value, and returns the result into the destination vector

This instruction is a pseudo-instruction of the VBIC (immediate) instruction. This means that:

- The encodings in this description are named to match the encodings of VBIC (immediate).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VBIC (immediate) gives the operational pseudocode for this instruction.

A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VAND{<c>}{<q>}.I16 {<Dd>,} <Dd>, #<imm>
```

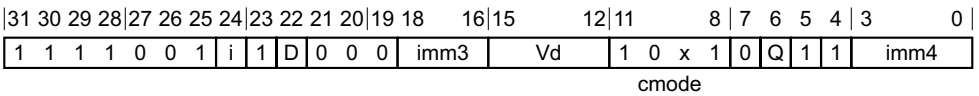
is equivalent to

```
VBIC{<c>}{<q>}.I16 <Dd>, #~<imm>
```

and is never the preferred disassembly.

128-bit SIMD vector variant

Applies when `Q == 1`.



```
VAND{<c>}{<q>}.I16 {<Qd>,} <Qd>, #<imm>
```

is equivalent to

```
VBIC{<c>}{<q>}.I16 <Qd>, #~<imm>
```

and is never the preferred disassembly.

A2

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VAND{<c>}{<q>}.I32 {<Dd>,} <Dd>, #<imm>
```

is equivalent to

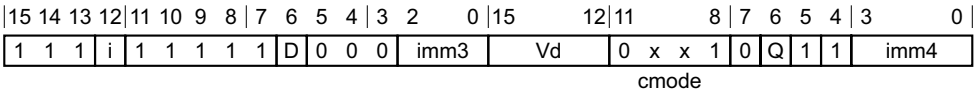
```
VBIC{<c>}{<q>}.I32 <Dd>, #~<imm>
```

and is never the preferred disassembly.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

128-bit SIMD vector variant

Applies when `Q == 1`.



```
VAND{<c>}{<q>}.I32 {<Qd>,} <Qd>, #<imm>
```

is equivalent to

```
VBIC{<c>}{<q>}.I32 <Qd>, #~<imm>
```

and is never the preferred disassembly.

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VAND{<c>}{<q>}.I16 {<Dd>,} <Dd>, #<imm>
```

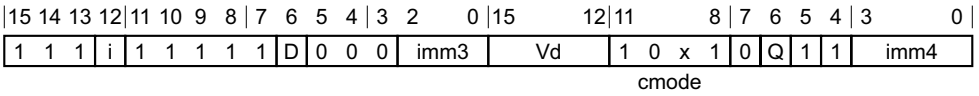
is equivalent to

```
VBIC{<c>}{<q>}.I16 <Dd>, #~<imm>
```

and is never the preferred disassembly.

128-bit SIMD vector variant

Applies when `Q == 1`.



```
VAND{<c>}{<q>}.I16 {<Qd>,} <Qd>, #<imm>
```

is equivalent to

```
VBIC{<c>}{<q>}.I16 <Qd>, #~<imm>
```

and is never the preferred disassembly.

T2

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VAND{<c>}{<q>}.I32 {<Dd>,} <Dd>, #<imm>
```

is equivalent to

```
VBIC{<c>}{<q>}.I32 <Dd>, #~<imm>
```

and is never the preferred disassembly.

128-bit SIMD vector variant

Applies when `Q == 1`.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

`VAND{<c>}{<q>}.I32 {<Qd>,} <Qd>, #<imm>`

is equivalent to

`VBIC{<c>}{<q>}.I32 <Qd>, #~<imm>`

and is never the preferred disassembly.

Assembler symbols

`<c>` For encoding A1 and A2: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1 and T2: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

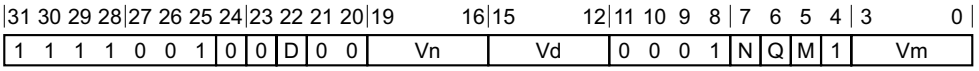
`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

`<imm>` Is a constant of the specified type that is replicated to fill the destination register. For details of the range of constants available and the encoding of `<imm>`, see *Modified immediate constants in T32 and A32 Advanced SIMD instructions* on page F2-3677.

Operation for all encodings

The description of VBIC (immediate) gives the operational pseudocode for this instruction.



Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

F6.1.33 VAND (register)

Vector Bitwise AND (register) performs a bitwise AND operation between two registers, and places the result in the destination register.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

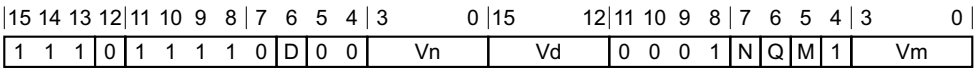
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VAND{<c>}{<q>}{.<dt>} {<Dd>,} <Dn>, <Dm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VAND{<c>}{<q>}{.<dt>} {<Qd>,} <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VAND{<c>}{<q>}{.<dt>} {<Dd>,} <Dn>, <Dm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VAND{<c>}{<q>}{.<dt>} {<Qd>,} <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

<q> See *Standard assembler syntax fields* on page F2-3660.

<dt> An optional data type. It is ignored by assemblers, and does not affect the encoding.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = D[n+r] AND D[m+r];
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

F6.1.34 VBIC (immediate)

Vector Bitwise Bit Clear (immediate) performs a bitwise AND between a register value and the complement of an immediate value, and returns the result into the destination vector.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

This instruction is used by the pseudo-instruction VAND (immediate). The pseudo-instruction is never the preferred disassembly.

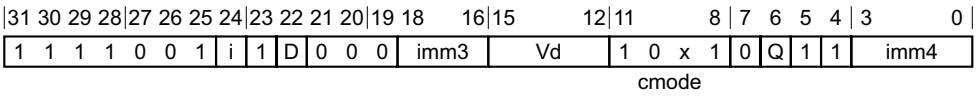
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VBIC{<c>}{<q>}.I32 {<Dd>,} <Dd>, #<imm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VBIC{<c>}{<q>}.I32 {<Qd>,} <Qd>, #<imm>
```

Decode for all variants of this encoding

```
if cmode<0> == '0' || cmode<3:2> == '11' then SEE "Related encodings";
if Q == '1' && Vd<0> == '1' then UNDEFINED;
imm64 = AdvSIMDExpandImm('1', cmode, i:imm3:imm4);
d = UInt(D:Vd);  regs = if Q == '0' then 1 else 2;
```

A2

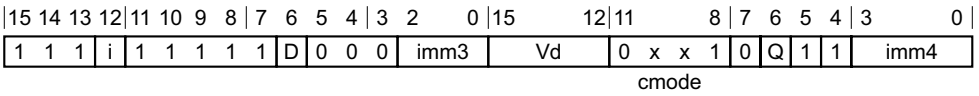
64-bit SIMD vector variant

Applies when `Q == 0`.

```
VBIC{<c>}{<q>}.I16 {<Dd>,} <Dd>, #<imm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.



```
VBIC{<c>}{<q>}.I16 {<Qd>,} <Qd>, #<imm>
```

Decode for all variants of this encoding

```
if cmode<0> == '0' || cmode<3:2> == '11' then SEE "Related encodings";
if Q == '1' && Vd<0> == '1' then UNDEFINED;
imm64 = AdvSIMDExpandImm('1', cmode, i:imm3:imm4);
d = UInt(D:Vd);  regs = if Q == '0' then 1 else 2;
```

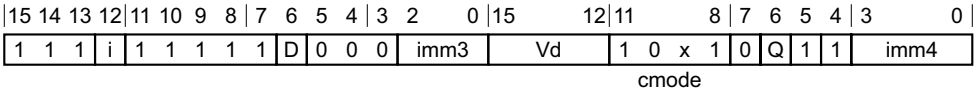
T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VBIC{<c>}{<q>}.I32 {<Dd>,} <Dd>, #<imm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VBIC{<c>}{<q>}.I32 {<Qd>,} <Qd>, #<imm>
```

Decode for all variants of this encoding

```
if cmode<0> == '0' || cmode<3:2> == '11' then SEE "Related encodings";
if Q == '1' && Vd<0> == '1' then UNDEFINED;
imm64 = AdvSIMDExpandImm('1', cmode, i:imm3:imm4);
d = UInt(D:Vd);  regs = if Q == '0' then 1 else 2;
```

T2

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VBIC{<c>}{<q>}.I16 {<Dd>,} <Dd>, #<imm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VBIC{<c>}{<q>}.I16 {<Qd>,} <Qd>, #<imm>
```

Decode for all variants of this encoding

```
if cmode<0> == '0' || cmode<3:2> == '11' then SEE "Related encodings";
if Q == '1' && Vd<0> == '1' then UNDEFINED;
imm64 = AdvSIMDExpandImm('1', cmode, i:imm3:imm4);
d = UInt(D:Vd);  regs = if Q == '0' then 1 else 2;
```

Notes for all encodings

Related encodings: See *Advanced SIMD one register and modified immediate* on page F3-3722 for the T32 instruction set, or *Advanced SIMD one register and modified immediate* on page F4-3807 for the A32 instruction set.

Assembler symbols

<c> For encoding A1 and A2: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

For encoding T1 and T2: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

`<imm>` Is a constant of the specified type that is replicated to fill the destination register. For details of the range of constants available and the encoding of `<imm>`, see *Modified immediate constants in T32 and A32 Advanced SIMD instructions* on page F2-3677.

The I8, I64, and F32 data types are permitted as pseudo-instructions, if the immediate can be represented by this instruction, and are encoded using a permitted encoding of the I16 or I32 data type.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = D[d+r] AND NOT(imm64);
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

F6.1.35 VBIC (register)

Vector Bitwise Bit Clear (register) performs a bitwise AND between a register value and the complement of a register value, and places the result in the destination register.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

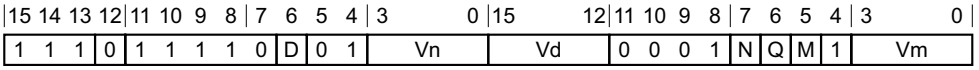
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VBIC{<c>}{<q>}{.<dt>} {<Dd>,} <Dn>, <Dm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VBIC{<c>}{<q>}{.<dt>} {<Qd>,} <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VBIC{<c>}{<q>}{.<dt>} {<Dd>,} <Dn>, <Dm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VBIC{<c>}{<q>}{.<dt>} {<Qd>,} <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

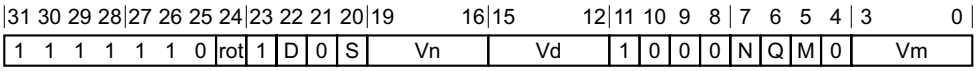
F6.1.39 VCADD

Vector Complex Add.



This instruction operates on complex numbers that are represented in SIMD&FP registers as pairs of elements, with the more significant element holding the imaginary part of the number and the less significant element holding the real part of the number. Each element holds a floating-point value. It performs the following computation on the corresponding complex number element pairs from the two source registers:

- Considering the complex number from the second source register on an Argand diagram, the number is rotated counterclockwise by 90 or 270 degrees.
- The rotated complex number is added to the complex number from the first source register.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

```

Assembler symbols

<q> See *Standard assembler syntax fields* on page F2-3660.

<dt> Is the data type for the elements of the vectors, encoded in the "S" field. It can have the following values:

F16	when S = 0
F32	when S = 1

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

<rotate> Is the rotation to be applied to elements in the second SIMD&FP source register, encoded in the "rot" field. It can have the following values:

90	when rot = 0
270	when rot = 1

Operation for all encodings

```
EncodingSpecificOperations();
CheckAdvSIMDEnabled();
for r = 0 to regs-1
    operand1 = D[n+r];
    operand2 = D[m+r];
    operand3 = D[d+r];
    for e = 0 to (elements DIV 2)-1
        case rot of
            when '0'
                element1 = FPNeg(Elem[operand2,e*2+1,esize]);
                element3 = Elem[operand2,e*2,esize];

F6.1.40 VCEQ (immediate #0)

Vector Compare Equal to Zero takes each element in a vector, and compares it with zero. If it is equal to zero, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

The operand vector elements are the same type, and are integers or floating-point numbers. The result vector elements are fields the same size as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

For encoding T1 and T2: see *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<dt> For encoding A1 and T1: is the data type for the elements of the operands, encoded in the "U:size" field. It can have the following values:

S8	when `U = 0, size = 00`
S16	when `U = 0, size = 01`
S32	when `U = 0, size = 10`
U8	when `U = 1, size = 00`
U16	when `U = 1, size = 01`
U32	when `U = 1, size = 10`

For encoding A2 and T2: is the data type for the elements of the vectors, encoded in the "sz" field. It can have the following values:

F32	when `sz = 0`
F16	when `sz = 1`

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
enumeration VCGEtype {VCGEtype_signed, VCGEtype_unsigned, VCGEtype_fp};

if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = Elem[D[n+r],e,esize];  op2 = Elem[D[m+r],e,esize];
            case vtype of
                when VCGEtype_signed    test_passed = (SInt(op1) >= SInt(op2));
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

```
        when VCGEtype_unsigned  test_passed = (UInt(op1) >= UInt(op2));
        when VCGEtype_fp        test_passed = FPCompareGE(op1, op2, StandardFPSCRValue());
    Elem[D[d+r],e,esize] = if test_passed then Ones(esize) else Zeros(esize);
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

F6.1.44 VCGT (immediate #0)

Vector Compare Greater Than Zero takes each element in a vector, and compares it with zero. If it is greater than zero, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

The operand vector elements are the same type, and are signed integers or floating-point numbers. The result vector elements are fields the same size as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

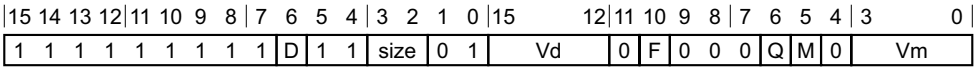
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VCGT{<c>}{<q>}.<dt> {<Dd>,} <Dm>, #0
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VCGT{<c>}{<q>}.<dt> {<Qd>,} <Qm>, #0
```

Decode for all variants of this encoding

```
if size == '11' then UNDEFINED;
if F == '1' && ((size == '01' && !HaveFP16Ext()) || size == '00') then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
floating_point = (F == '1');
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VCGT{<c>}{<q>}.<dt> {<Dd>,} <Dm>, #0
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VCGT{<c>}{<q>}.<dt> {<Qd>,} <Qm>, #0
```

Decode for all variants of this encoding

```
if size == '11' then UNDEFINED;
if F == '1' && ((size == '01' && !HaveFP16Ext()) || size == '00') then UNDEFINED;
if F == '1' && size == '01' && InITBlock() then UNPREDICTABLE;
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

```
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
floating_point = (F == '1');
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

CONSTRAINED UNPREDICTABLE behavior

If `F == '1' && size == '01' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

`<c>` For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<dt>` Is the data type for the elements of the operands, encoded in the "F:size" field. It can have the following values:

F6.1.47 VCLE (register)

Vector Compare Less Than or Equal takes each element in a vector, and compares it with the corresponding element of a second vector. If the first is less than or equal to the second, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros

This instruction is a pseudo-instruction of the VCGE (register) instruction. This means that:

- The encodings in this description are named to match the encodings of VCGE (register).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VCGE (register) gives the operational pseudocode for this instruction.

A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VCLE{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

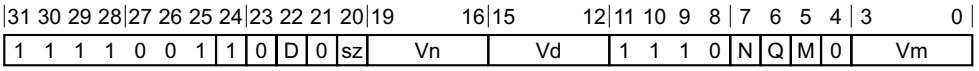
is equivalent to

```
VCGE{<c>}{<q>}.<dt> <Dd>, <Dm>, <Dn>
```

and is never the preferred disassembly.

128-bit SIMD vector variant

Applies when `Q == 1`.



```
VCLE{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>
```

is equivalent to

```
VCGE{<c>}{<q>}.<dt> <Qd>, <Qm>, <Qn>
```

and is never the preferred disassembly.

A2

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VCLE{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

is equivalent to

```
VCGE{<c>}{<q>}.<dt> <Dd>, <Dm>, <Dn>
```

and is never the preferred disassembly.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<dt>` For encoding A1 and T1: is the data type for the elements of the operands, encoded in the "U:size" field. It can have the following values:

- `S8` when `U = 0, size = 00`
- `S16` when `U = 0, size = 01`
- `S32` when `U = 0, size = 10`
- `U8` when `U = 1, size = 00`
- `U16` when `U = 1, size = 01`
- `U32` when `U = 1, size = 10`

For encoding A2 and T2: is the data type for the elements of the vectors, encoded in the "sz" field. It can have the following values:

- `F32` when `sz = 0`
- `F16` when `sz = 1`

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

Operation for all encodings

The description of VCGE (register) gives the operational pseudocode for this instruction.

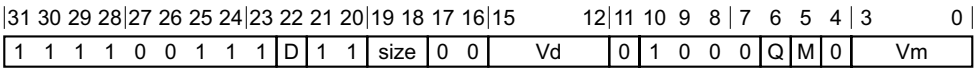
F6.1.48 VCLS



Vector Count Leading Sign Bits counts the number of consecutive bits following the topmost bit, that are the same as the topmost bit, in each element in a vector, and places the results in a second vector. The count does not include the topmost bit itself.

The operand vector elements can be any one of 8-bit, 16-bit, or 32-bit signed integers.

The result vector elements are the same data type as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

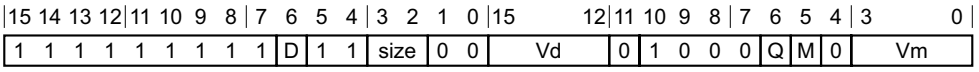
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VCLS{<c>}{<q>}.<dt> <Dd>, <Dm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VCLS{<c>}{<q>}.<dt> <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if size == '11' then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VCLS{<c>}{<q>}.<dt> <Dd>, <Dm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VCLS{<c>}{<q>}.<dt> <Qd>, <Qm>
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Decode for all variants of this encoding

```
if size == '11' then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<dt> Is the data type for the elements of the operands, encoded in the "size" field. It can have the following values:

- S8 when size = 00
- S16 when size = 01
- S32 when size = 10

The encoding size = 11 is reserved.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            Elem[D[d+r],e,esize] = CountLeadingSignBits(Elem[D[m+r],e,esize])<esize-1:0>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

F6.1.49 VCLT (immediate #0)

Vector Compare Less Than Zero takes each element in a vector, and compares it with zero. If it is less than zero, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

The operand vector elements are the same type, and are signed integers or floating-point numbers. The result vector elements are fields the same size as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

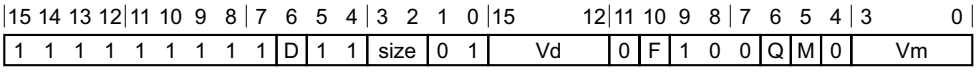
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VCLT{<c>}{<q>}.<dt> {<Dd>,} <Dm>, #0
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VCLT{<c>}{<q>}.<dt> {<Qd>,} <Qm>, #0
```

Decode for all variants of this encoding

```
if size == '11' then UNDEFINED;
if F == '1' && ((size == '01' && !HaveFP16Ext()) || size == '00') then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
floating_point = (F == '1');
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VCLT{<c>}{<q>}.<dt> {<Dd>,} <Dm>, #0
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VCLT{<c>}{<q>}.<dt> {<Qd>,} <Qm>, #0
```

Decode for all variants of this encoding

```
if size == '11' then UNDEFINED;
if F == '1' && ((size == '01' && !HaveFP16Ext()) || size == '00') then UNDEFINED;
if F == '1' && size == '01' && InITBlock() then UNPREDICTABLE;
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

```
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
floating_point = (F == '1');
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

CONSTRAINED UNPREDICTABLE behavior

If `F == '1' && size == '01' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<dt> Is the data type for the elements of the operands, encoded in the "F:size" field. It can have the following values:

S8	when F = 0, size = 00
S16	when F = 0, size = 01
S32	when F = 0, size = 10
F16	when F = 1, size = 01
F32	when F = 1, size = 10

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            if floating_point then
                bits(esize) zero = FPZero('0');
                test_passed = FPCompareGT(zero, Elem[D[m+r],e,esize], StandardFPSCRValue());
            else
                test_passed = (SInt(Elem[D[m+r],e,esize]) < 0);
            Elem[D[d+r],e,esize] = if test_passed then Ones(esize) else Zeros(esize);
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

F6.1.50 VCLT (register)

Vector Compare Less Than takes each element in a vector, and compares it with the corresponding element of a second vector. If the first is less than the second, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros

This instruction is a pseudo-instruction of the VCGT (register) instruction. This means that:

- The encodings in this description are named to match the encodings of VCGT (register).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VCGT (register) gives the operational pseudocode for this instruction.

A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VCLT{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

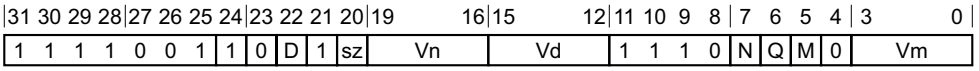
is equivalent to

```
VCGT{<c>}{<q>}.<dt> <Dd>, <Dm>, <Dn>
```

and is never the preferred disassembly.

128-bit SIMD vector variant

Applies when `Q == 1`.



```
VCLT{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>
```

is equivalent to

```
VCGT{<c>}{<q>}.<dt> <Qd>, <Qm>, <Qn>
```

and is never the preferred disassembly.

A2

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VCLT{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

is equivalent to

```
VCGT{<c>}{<q>}.<dt> <Dd>, <Dm>, <Dn>
```

and is never the preferred disassembly.

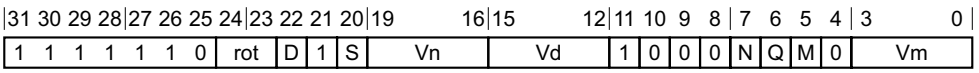
F6.1.52 VCMLA

Vector Complex Multiply Accumulate.

This instruction operates on complex numbers that are represented in SIMD&FP registers as pairs of elements, with the more significant element holding the imaginary part of the number and the less significant element holding the real part of the number. Each element holds a floating-point value. It performs the following computation on the corresponding complex number element pairs from the two source registers and the destination register:



- Considering the complex number from the second source register on an Argand diagram, the number is rotated counterclockwise by 0, 90, 180, or 270 degrees.
- The two elements of the transformed complex number are multiplied by:
  - The real element of the complex number from the first source register, if the transformation was a rotation by 0 or 180 degrees.
  - The imaginary element of the complex number from the first source register, if the transformation was a rotation by 90 or 270 degrees.
- The complex number resulting from that multiplication is added to the complex number from the destination register.

The multiplication and addition operations are performed as a fused multiply-add, without any intermediate rounding.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

```

Assembler symbols

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<dt>` Is the data type for the elements of the vectors, encoded in the "S" field. It can have the following values:

- `F16` when `S = 0`
- `F32` when `S = 1`

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Qn>` Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

`<Qm>` Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

`<Dn>` Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

`<Dm>` Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

`<rotate>` Is the rotation to be applied to elements in the second SIMD&FP source register, encoded in the "rot" field. It can have the following values:

- `0` when `rot = 00`
- `90` when `rot = 01`
- `180` when `rot = 10`
- `270` when `rot = 11`

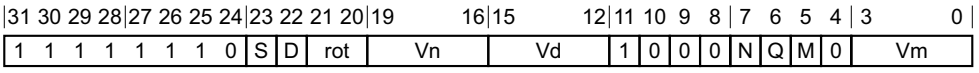
F6.1.53 VCMLA (by element)

Vector Complex Multiply Accumulate (by element).

This instruction operates on complex numbers that are represented in SIMD&FP registers as pairs of elements, with the more significant element holding the imaginary part of the number and the less significant element holding the real part of the number. Each element holds a floating-point value. It performs the following computation on complex numbers from the first source register and the destination register with the specified complex number from the second source register:



- Considering the complex number from the second source register on an Argand diagram, the number is rotated counterclockwise by 0, 90, 180, or 270 degrees.
- The two elements of the transformed complex number are multiplied by:
  - The real element of the complex number from the first source register, if the transformation was a rotation by 0 or 180 degrees.
  - The imaginary element of the complex number from the first source register, if the transformation was a rotation by 90 or 270 degrees.
- The complex number resulting from that multiplication is added to the complex number from the destination register.

The multiplication and addition operations are performed as a fused multiply-add, without any intermediate rounding.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

F6.1.54 VCMP

Vector Compare compares two floating-point registers, or one floating-point register and zero. It writes the result to the FPSCR flags. These are normally transferred to the PSTATE.{N, Z, C, V} Condition flags by a subsequent `VMRS` instruction.

It raises an Invalid Operation exception only if either operand is a signaling NaN.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1

Half-precision scalar variant

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<Sd>` Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.

`<Sm>` Is the 32-bit name of the SIMD&FP source register, encoded in the "Vm:M" field.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

`<Dm>` Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

NaNs

The IEEE 754 standard specifies that the result of a comparison is precisely one of <, ==, > or unordered. If either or both of the operands are NaNs, they are unordered, and all three of (Operand1 < Operand2), (Operand1 == Operand2) and (Operand1 > Operand2) are false. This results in the FPSCR flags being set as N=0, Z=0, C=1 and V=1.

`VCMPE` raises an Invalid Operation exception if either operand is any type of NaN, and is suitable for testing for <, <=, >, >=, and other predicates that raise an exception when the operands are unordered.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckVFPEnabled(TRUE);
    bits(4) nzcv;
    case esize of
        when 16
            bits(16) op16 = if with_zero then FPZero('0') else S[m]<15:0>;
            nzcv = FPCompare(S[d]<15:0>, op16, quiet_nan_exc, FPSCR);
        when 32
            bits(32) op32 = if with_zero then FPZero('0') else S[m];
            nzcv = FPCompare(S[d], op32, quiet_nan_exc, FPSCR);
        when 64
            bits(64) op64 = if with_zero then FPZero('0') else D[m];
            nzcv = FPCompare(D[d], op64, quiet_nan_exc, FPSCR);

    FPSCR.<N,Z,C,V> = nzcv;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

    FPSCR.<N,Z,C,V> = nzcv;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

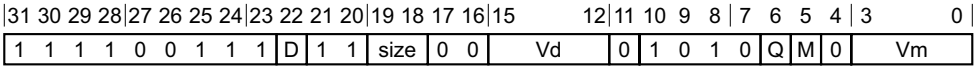
F6.1.56 VCNT



Vector Count Set Bits counts the number of bits that are one in each element in a vector, and places the results in a second vector.

The operand vector elements must be 8-bit fields.

The result vector elements are 8-bit integers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

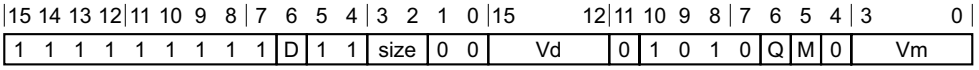
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VCNT{<c>}{<q>}.8 <Dd>, <Dm> // Encoded as Q = 0
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VCNT{<c>}{<q>}.8 <Qd>, <Qm> // Encoded as Q = 1
```

Decode for all variants of this encoding

```
if size != '00' then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
esize = 8;  elements = 8;
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VCNT{<c>}{<q>}.8 <Dd>, <Dm> // Encoded as Q = 0
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VCNT{<c>}{<q>}.8 <Qd>, <Qm> // Encoded as Q = 1
```

Decode for all variants of this encoding

```
if size != '00' then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
esize = 8;  elements = 8;
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

F6.1.57 VCVT (between double-precision and single-precision)

Convert between double-precision and single-precision does one of the following:

- Converts the value in a double-precision register to single-precision and writes the result to a single-precision register.
- Converts the value in a single-precision register to double-precision and writes the result to a double-precision register.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

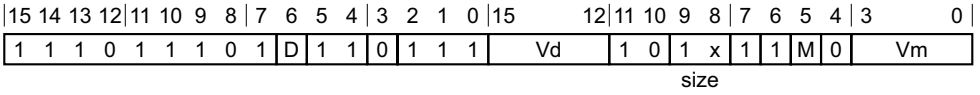
A1

Single-precision to double-precision variant

Applies when `size == 10`.

```
VCVT{<c>}{<q>}.F64.F32 <Dd>, <Sm>
```

Double-precision to single-precision variant



Applies when `size == 11`.

```
VCVT{<c>}{<q>}.F32.F64 <Sd>, <Dm>
```

Decode for all variants of this encoding

```
double_to_single = (size == '11');
d = if double_to_single then UInt(Vd:D) else UInt(D:Vd);
m = if double_to_single then UInt(M:Vm) else UInt(Vm:M);
```

T1

Single-precision to double-precision variant

Applies when `size == 10`.

```
VCVT{<c>}{<q>}.F64.F32 <Dd>, <Sm>
```

Double-precision to single-precision variant

Applies when `size == 11`.

```
VCVT{<c>}{<q>}.F32.F64 <Sd>, <Dm>
```

Decode for all variants of this encoding

```
double_to_single = (size == '11');
d = if double_to_single then UInt(Vd:D) else UInt(D:Vd);
m = if double_to_single then UInt(M:Vm) else UInt(Vm:M);
```

F6.1.58 VCVT (between half-precision and single-precision, Advanced SIMD)

Vector Convert between half-precision and single-precision converts each element in a vector from single-precision to half-precision floating-point, or from half-precision to single-precision, and places the results in a second vector.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

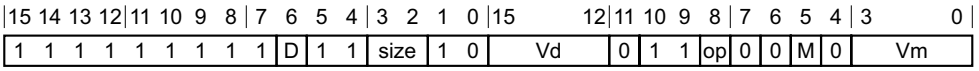
A1

Half-precision to single-precision variant

Applies when `op == 1`.

```
VCVT{<c>}{<q>}.F32.F16 <Qd>, <Dm> // Encoded as op = 1
```

Single-precision to half-precision variant



Applies when `op == 0`.

```
VCVT{<c>}{<q>}.F16.F32 <Dd>, <Qm> // Encoded as op = 0
```

Decode for all variants of this encoding

```
if size != '01' then UNDEFINED;
half_to_single = (op == '1');
if half_to_single && Vd<0> == '1' then UNDEFINED;
if !half_to_single && Vm<0> == '1' then UNDEFINED;
esize = 16;  elements = 4;
m = UInt(M:Vm);  d = UInt(D:Vd);
```

T1

Half-precision to single-precision variant

Applies when `op == 1`.

```
VCVT{<c>}{<q>}.F32.F16 <Qd>, <Dm> // Encoded as op = 1
```

Single-precision to half-precision variant

Applies when `op == 0`.

```
VCVT{<c>}{<q>}.F16.F32 <Dd>, <Qm> // Encoded as op = 0
```

Decode for all variants of this encoding

```
if size != '01' then UNDEFINED;
half_to_single = (op == '1');
if half_to_single && Vd<0> == '1' then UNDEFINED;
if !half_to_single && Vm<0> == '1' then UNDEFINED;
esize = 16;  elements = 4;
m = UInt(M:Vm);  d = UInt(D:Vd);
```

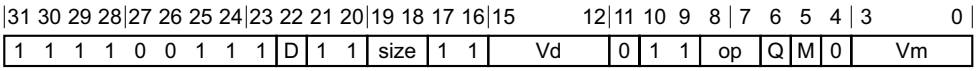
F6.1.59 VCVT (between floating-point and integer, Advanced SIMD)



Vector Convert between floating-point and integer converts each element in a vector from floating-point to integer, or from integer to floating-point, and places the results in a second vector.

The vector elements are the same type, and are floating-point numbers or integers. Signed and unsigned integers are distinct.

The floating-point to integer operation uses the Round towards Zero rounding mode. The integer to floating-point operation uses the Round to Nearest rounding mode.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

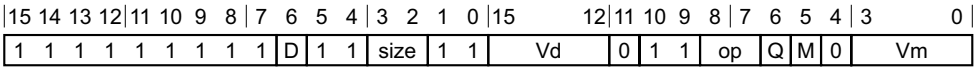
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VCVT{<c>}{<q>}.<dt1>.<dt2> <Dd>, <Dm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VCVT{<c>}{<q>}.<dt1>.<dt2> <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
if (size == '01' && !HaveFP16Ext()) || size IN {'00', '11'} then UNDEFINED;
to_integer = (op<1> == '1');  unsigned = (op<0> == '1');
case size of
    when '01' esize = 16; elements = 4;
    when '10' esize = 32; elements = 2;
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VCVT{<c>}{<q>}.<dt1>.<dt2> <Dd>, <Dm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VCVT{<c>}{<q>}.<dt1>.<dt2> <Qd>, <Qm>
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
if (size == '01' && !HaveFP16Ext()) || size IN {'00', '11'} then UNDEFINED;
if size == '01' && InITBlock()  then UNPREDICTABLE;
to_integer = (op<1> == '1');  unsigned = (op<0> == '1');
case size of
    when '01' esize = 16; elements = 4;
    when '10' esize = 32; elements = 2;
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

`<c>` For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<dt1>` Is the data type for the elements of the destination vector, encoded in the "size:op" field. It can have the following values:

F16	when `size = 01`, `op = 0x`
S16	when `size = 01`, `op = 10`
U16	when `size = 01`, `op = 11`
F32	when `size = 10`, `op = 0x`
S32	when `size = 10`, `op = 10`
U32	when `size = 10`, `op = 11`

`<dt2>` Is the data type for the elements of the source vector, encoded in the "size:op" field. It can have the following values:

S16	when `size = 01`, `op = 00`
U16	when `size = 01`, `op = 01`
F16	when `size = 01`, `op = 1x`
S32	when `size = 10`, `op = 00`
U32	when `size = 10`, `op = 01`
F32	when `size = 10`, `op = 1x`

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Qm>` Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

`<Dm>` Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

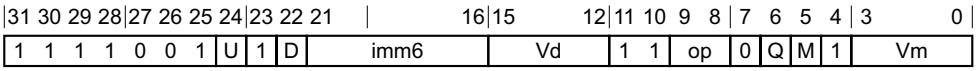
F6.1.62 VCVT (between floating-point and fixed-point, Advanced SIMD)



Vector Convert between floating-point and fixed-point converts each element in a vector from floating-point to fixed-point, or from fixed-point to floating-point, and places the results in a second vector.

The vector elements are the same type, and are floating-point numbers or integers. Signed and unsigned integers are distinct.

The floating-point to fixed-point operation uses the Round towards Zero rounding mode. The fixed-point to floating-point operation uses the Round to Nearest rounding mode.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

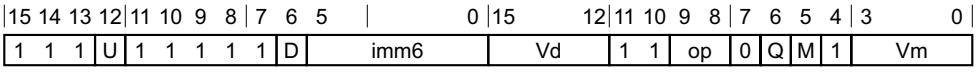
A1

64-bit SIMD vector variant

Applies when `imm6 != 000xxx && Q == 0`.

```
VCVT{<c>}{<q>}.<dt1>.<dt2> <Dd>, <Dm>, #<fbits>
```

128-bit SIMD vector variant



Applies when `imm6 != 000xxx && Q == 1`.

```
VCVT{<c>}{<q>}.<dt1>.<dt2> <Qd>, <Qm>, #<fbits>
```

Decode for all variants of this encoding

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<dt1> Is the data type for the elements of the destination vector, encoded in the "op:U" field. It can have the following values:

- F16 when op = 00, U = x
- S16 when op = 01, U = 0
- U16 when op = 01, U = 1
- F32 when op = 10, U = x
- S32 when op = 11, U = 0
- U32 when op = 11, U = 1

<dt2> Is the data type for the elements of the source vector, encoded in the "op:U" field. It can have the following values:

- S16 when op = 00, U = 0
- U16 when op = 00, U = 1
- F16 when op = 01, U = x
- S32 when op = 10, U = 0
- U32 when op = 10, U = 1
- F32 when op = 11, U = x

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

<fbits> The number of fraction bits in the fixed point number, in the range 1 to 32 for 32-bit elements, or in the range 1 to 16 for 16-bit elements:

- (64 - <fbits>) is encoded in imm6.

An assembler can permit an <fbits> value of 0. This is encoded as floating-point to integer or integer to floating-point instruction, see VCVT (between floating-point and integer, Advanced SIMD).

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    bits(esize) result;
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = Elem[D[m+r],e,esize];
            if to_fixed then
                result = FPToFixed(op1, frac_bits, unsigned, StandardFPSCRValue(),
                                   FPRounding_ZERO);
            else
                result = FixedToFP(op1, frac_bits, unsigned, StandardFPSCRValue(),
                                   FPRounding_TIEEVEN);
            Elem[D[d+r],e,esize] = result;
```

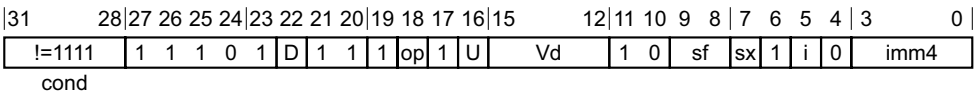
F6.1.63 VCVT (between floating-point and fixed-point, floating-point)



Convert between floating-point and fixed-point converts a value in a register from floating-point to fixed-point, or from fixed-point to floating-point. Software can specify the fixed-point value as either signed or unsigned.

The fixed-point value can be 16-bit or 32-bit. Conversions from fixed-point values take their operand from the low-order bits of the source register and ignore any remaining bits. Signed conversions to fixed-point values sign-extend the result value to the destination register width. Unsigned conversions to fixed-point values zero-extend the result value to the destination register width.

The floating-point to fixed-point operation uses the Round towards Zero rounding mode. The fixed-point to floating-point operation uses the Round to Nearest rounding mode.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1

Half-precision scalar variant

Applies when `op == 0 && sf == 01`.

```
VCVT{<c>}{<q>}.F16.<dt> <Sdm>, <Sdm>, #<fbits>
```

Half-precision scalar variant

Applies when `op == 1 && sf == 01`.

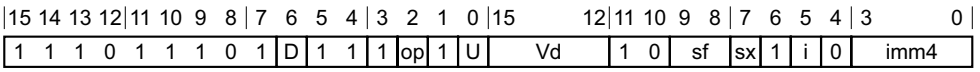
    when '11' fp_size = 64; d = UInt(D:Vd);



if frac_bits < 0 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `frac_bits < 0`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The value in the destination register is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VCVT (between floating-point and fixed-point)* on page K1-7205.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<dt>` Is the data type for the fixed-point number, encoded in the "U:sx" field. It can have the following values:

`S16`	when `U = 0, sx = 0`
`S32`	when `U = 0, sx = 1`
`U16`	when `U = 1, sx = 0`
`U32`	when `U = 1, sx = 1`

`<Sdm>` Is the 32-bit name of the SIMD&FP destination and source register, encoded in the "Vd:D" field.

`<Ddm>` Is the 64-bit name of the SIMD&FP destination and source register, encoded in the "D:Vd" field.

`<fbits>` The number of fraction bits in the fixed-point number:

- If `<dt>` is `S16` or `U16`, `<fbits>` must be in the range 0-16. (16 - `<fbits>`) is encoded in `[imm4, i]`
- If `<dt>` is `S32` or `U32`, `<fbits>` must be in the range 1-32. (32 - `<fbits>`) is encoded in `[imm4, i]`.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckVFPEnabled(TRUE);
    if to_fixed then
        bits(size) result;
        case fp_size of
            when 16
                result = FPToFixed(S[d]<15:0>, frac_bits, unsigned, FPSCR, FPRounding_ZERO);
                S[d] = Extend(result, 32, unsigned);
            when 32
```

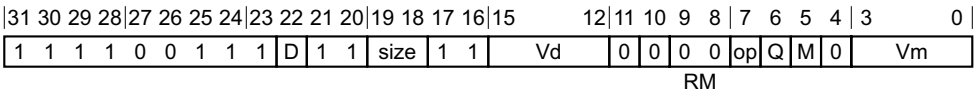
F6.1.64 VCVTA (Advanced SIMD)



Vector Convert floating-point to integer with Round to Nearest with Ties to Away converts each element in a vector from floating-point to integer using the Round to Nearest with Ties to Away rounding mode, and places the results in a second vector.

The operand vector elements are floating-point numbers.

The result vector elements are 32-bit integers. Signed and unsigned integers are distinct.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

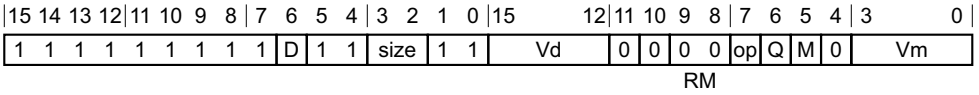
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VCVTA{<q>}.<dt>.<dt2> <Dd>, <Dm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VCVTA{<q>}.<dt>.<dt2> <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
if (size == '01' && !HaveFP16Ext()) || size IN {'00', '11'} then UNDEFINED;
rounding = FPDecodeRM(RM);  unsigned = (op == '1');
case size of
    when '01' esize = 16; elements = 4;
    when '10' esize = 32; elements = 2;
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VCVTA{<q>}.<dt>.<dt2> <Dd>, <Dm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VCVTA{<q>}.<dt>.<dt2> <Qd>, <Qm>
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Decode for all variants of this encoding

```
if InITBlock() then UNPREDICTABLE;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
if (size == '01' && !HaveFP16Ext()) || size IN {'00', '11'} then UNDEFINED;
rounding = FPDecodeRM(RM);  unsigned = (op == '1');
case size of
    when '01' esize = 16; elements = 4;
    when '10' esize = 32; elements = 2;
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

CONSTRAINED UNPREDICTABLE behavior

If `InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<dt>` Is the data type for the elements of the destination, encoded in the "op" field. It can have the following values:

- `S32` when `op = 0`
- `U32` when `op = 1`

`<dt2>` Is the data type for the elements of the source vector, encoded in the "size" field. It can have the following values:

- `F16` when `size = 01`
- `F32` when `size = 10`

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Qm>` Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

`<Dm>` Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
EncodingSpecificOperations(); CheckAdvSIMDEnabled();
bits(esize) result;
for r = 0 to regs-1
    for e = 0 to elements-1
        Elem[D[d+r],e,esize] = FPToFixed(Elem[D[m+r],e,esize], 0, unsigned,
                                         StandardFPSCRValue(), rounding);
```

F6.1.65 VCVTA (floating-point)

Convert floating-point to integer with Round to Nearest with Ties to Away converts a value in a register from floating-point to a 32-bit integer using the Round to Nearest with Ties to Away rounding mode, and places the result in a second register.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1

Half-precision scalar variant

Applies when `size == 01`.

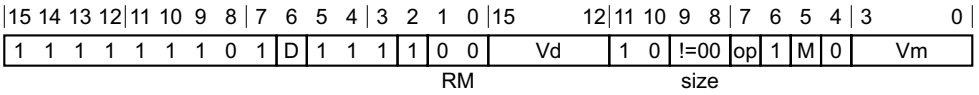
```
VCVTA{<q>}.<dt>.F16 <Sd>, <Sm>
```

Single-precision scalar variant

Applies when `size == 10`.

```
VCVTA{<q>}.<dt>.F32 <Sd>, <Sm>
```

Double-precision scalar variant



Applies when `size == 11`.

```
VCVTA{<q>}.<dt>.F64 <Sd>, <Dm>
```

Decode for all variants of this encoding

```
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
rounding = FPDecodeRM(RM);  unsigned = (op == '0');
d = UInt(Vd:D);
case size of
    when '01' esize = 16; m = UInt(Vm:M);
    when '10' esize = 32; m = UInt(Vm:M);
    when '11' esize = 64; m = UInt(M:Vm);
```

T1

Half-precision scalar variant

Applies when `size == 01`.

```
VCVTA{<q>}.<dt>.F16 <Sd>, <Sm>
```

Single-precision scalar variant

Applies when `size == 10`.

```
VCVTA{<q>}.<dt>.F32 <Sd>, <Sm>
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Double-precision scalar variant

Applies when size == 11.

```
VCVTA{<q>}.<dt>.F64 <Sd>, <Dm>
```

Decode for all variants of this encoding

```
if InITBlock() then UNPREDICTABLE;
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
rounding = FPDecodeRM(RM);  unsigned = (op == '0');
d = UInt(Vd:D);
case size of
    when '01' esize = 16; m = UInt(Vm:M);
    when '10' esize = 32; m = UInt(Vm:M);
    when '11' esize = 64; m = UInt(M:Vm);
```

CONSTRAINED UNPREDICTABLE behavior

If InITBlock(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

<q> See *Standard assembler syntax fields* on page F2-3660.

<dt> Is the data type for the elements of the destination, encoded in the "op" field. It can have the following values:

- U32 when op = 0
- S32 when op = 1

<Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.

<Sm> Is the 32-bit name of the SIMD&FP source register, encoded in the "Vm:M" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
case esize of
    when 16
        S[d] = FPToFixed(S[m]<15:0>, 0, unsigned, FPSCR, rounding);
    when 32
        S[d] = FPToFixed(S[m], 0, unsigned, FPSCR, rounding);
    when 64
        S[d] = FPToFixed(D[m], 0, unsigned, FPSCR, rounding);
```

F6.1.66 VCVTB

Convert to or from a half-precision value in the bottom half of a single-precision register does one of the following:

- Converts the half-precision value in the bottom half of a single-precision register to single-precision and writes the result to a single-precision register.
- Converts the half-precision value in the bottom half of a single-precision register to double-precision and writes the result to a double-precision register.
- Converts the single-precision value in a single-precision register to half-precision and writes the result into the bottom half of a single-precision register, preserving the other half of the destination register.
- Converts the double-precision value in a double-precision register to half-precision and writes the result into the bottom half of a single-precision register, preserving the other half of the destination register.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1

Half-precision to single-precision variant

Applies when `op == 0 && sz == 0`.

```
VCVTB{<c>}{<q>}.F32.F16 <Sd>, <Sm>
```

Half-precision to double-precision variant

Applies when `op == 0 && sz == 1`.

```
VCVTB{<c>}{<q>}.F64.F16 <Dd>, <Sm>
```

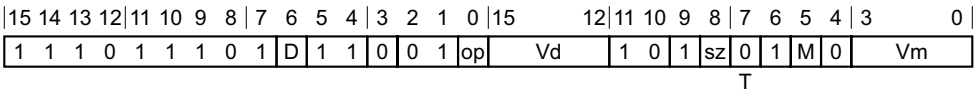
Single-precision to half-precision variant

Applies when `op == 1 && sz == 0`.

```
VCVTB{<c>}{<q>}.F16.F32 <Sd>, <Sm>
```

Double-precision to half-precision variant

Applies when `op == 1 && sz == 1`.



```
VCVTB{<c>}{<q>}.F16.F64 <Sd>, <Dm>
```

Decode for all variants of this encoding

```
uses_double = (sz == '1'); convert_from_half = (op == '0');
lowbit = (if T == '1' then 16 else 0);
if uses_double then
    if convert_from_half then
        d = UInt(D:Vd); m = UInt(Vm:M);
    else
        d = UInt(Vd:D); m = UInt(M:Vm);
else
    d = UInt(Vd:D); m = UInt(Vm:M);
```

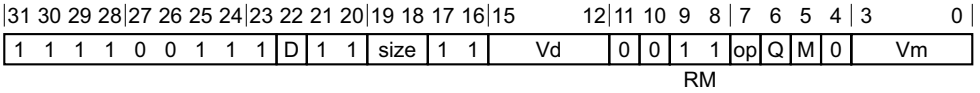
F6.1.67 VCVTM (Advanced SIMD)



Vector Convert floating-point to integer with Round towards -Infinity converts each element in a vector from floating-point to integer using the Round towards -Infinity rounding mode, and places the results in a second vector.

The operand vector elements are floating-point numbers.

The result vector elements are 32-bit integers. Signed and unsigned integers are distinct.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

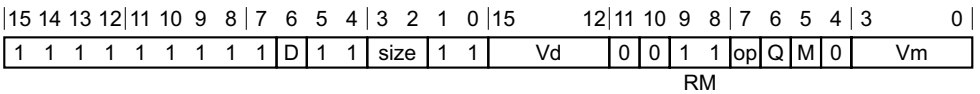
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VCVTM{<q>}.<dt>.<dt2> <Dd>, <Dm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VCVTM{<q>}.<dt>.<dt2> <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
if (size == '01' && !HaveFP16Ext()) || size IN {'00', '11'} then UNDEFINED;
rounding = FPDecodeRM(RM);  unsigned = (op == '1');
case size of
    when '01' esize = 16; elements = 4;
    when '10' esize = 32; elements = 2;
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VCVTM{<q>}.<dt>.<dt2> <Dd>, <Dm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VCVTM{<q>}.<dt>.<dt2> <Qd>, <Qm>
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Decode for all variants of this encoding

```
if InITBlock() then UNPREDICTABLE;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
if (size == '01' && !HaveFP16Ext()) || size IN {'00', '11'} then UNDEFINED;
rounding = FPDecodeRM(RM);  unsigned = (op == '1');
case size of
    when '01' esize = 16; elements = 4;
    when '10' esize = 32; elements = 2;
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

CONSTRAINED UNPREDICTABLE behavior

If `InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<dt>` Is the data type for the elements of the destination, encoded in the "op" field. It can have the following values:

- `S32` when `op = 0`
- `U32` when `op = 1`

`<dt2>` Is the data type for the elements of the source vector, encoded in the "size" field. It can have the following values:

- `F16` when `size = 01`
- `F32` when `size = 10`

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Qm>` Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

`<Dm>` Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
EncodingSpecificOperations(); CheckAdvSIMDEnabled();
bits(esize) result;
for r = 0 to regs-1
    for e = 0 to elements-1
        Elem[D[d+r],e,esize] = FPToFixed(Elem[D[m+r],e,esize], 0, unsigned,
                                         StandardFPSCRValue(), rounding);
```

Decode for all variants of this encoding

```
if InITBlock() then UNPREDICTABLE;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
if (size == '01' && !HaveFP16Ext()) || size IN {'00', '11'} then UNDEFINED;
rounding = FPDecodeRM(RM);  unsigned = (op == '1');
case size of
    when '01' esize = 16; elements = 4;
    when '10' esize = 32; elements = 2;
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

CONSTRAINED UNPREDICTABLE behavior

If `InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<dt>` Is the data type for the elements of the destination, encoded in the "op" field. It can have the following values:

- `S32` when `op = 0`
- `U32` when `op = 1`

`<dt2>` Is the data type for the elements of the source vector, encoded in the "size" field. It can have the following values:

- `F16` when `size = 01`
- `F32` when `size = 10`

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Qm>` Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

`<Dm>` Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
EncodingSpecificOperations(); CheckAdvSIMDEnabled();
bits(esize) result;
for r = 0 to regs-1
    for e = 0 to elements-1
        Elem[D[d+r],e,esize] = FPToFixed(Elem[D[m+r],e,esize], 0, unsigned,
                                         StandardFPSCRValue(), rounding);
```

F6.1.72 VCVTP (floating-point)

Convert floating-point to integer with Round towards +Infinity converts a value in a register from floating-point to a 32-bit integer using the Round towards +Infinity rounding mode, and places the result in a second register.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1

Half-precision scalar variant

Applies when `size == 01`.

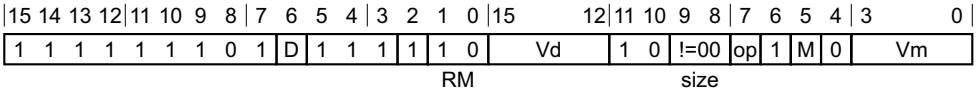
```
VCVTP{<q>}.<dt>.F16 <Sd>, <Sm>
```

Single-precision scalar variant

Applies when `size == 10`.

```
VCVTP{<q>}.<dt>.F32 <Sd>, <Sm>
```

Double-precision scalar variant



Applies when `size == 11`.

```
VCVTP{<q>}.<dt>.F64 <Sd>, <Dm>
```

Decode for all variants of this encoding

```
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
rounding = FPDecodeRM(RM);  unsigned = (op == '0');
d = UInt(Vd:D);
case size of
    when '01' esize = 16; m = UInt(Vm:M);
    when '10' esize = 32; m = UInt(Vm:M);
    when '11' esize = 64; m = UInt(M:Vm);
```

F6.1.73 VCVTR

Convert floating-point to integer converts a value in a register from floating-point to a 32-bit integer, using the rounding mode specified by the FPSCR and places the result in a second register.

VCVT (between floating-point and fixed-point, floating-point) describes conversions between floating-point and 16-bit integers.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

F6.1.74 VCVTT

Convert to or from a half-precision value in the top half of a single-precision register does one of the following:

- Converts the half-precision value in the top half of a single-precision register to single-precision and writes the result to a single-precision register.
- Converts the half-precision value in the top half of a single-precision register to double-precision and writes the result to a double-precision register.
- Converts the single-precision value in a single-precision register to half-precision and writes the result into the top half of a single-precision register, preserving the other half of the destination register.
- Converts the double-precision value in a double-precision register to half-precision and writes the result into the top half of a single-precision register, preserving the other half of the destination register.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

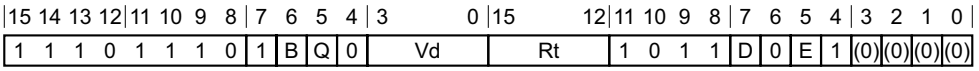
F6.1.76 VDUP (general-purpose register)

Duplicate general-purpose register to vector duplicates an element from a general-purpose register into every element of the destination vector.

The destination vector elements can be 8-bit, 16-bit, or 32-bit fields. The source element is the least significant 8, 16, or 32 bits of the general-purpose register. There is no distinction between data types.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1



A1 variant

```
VDUP{<c>}{<q>}.<size> <Qd>, <Rt> // Encoded as Q = 1
VDUP{<c>}{<q>}.<size> <Dd>, <Rt> // Encoded as Q = 0
```

Decode for this encoding

```
if Q == '1' && Vd<0> == '1' then UNDEFINED;
d = UInt(D:Vd);  t = UInt(Rt);  regs = if Q == '0' then 1 else 2;
case B:E of
    when '00'  esize = 32;  elements = 2;
    when '01'  esize = 16;  elements = 4;
    when '10'  esize = 8;   elements = 8;
    when '11'  UNDEFINED;
if t == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

T1

T1 variant

```
VDUP{<c>}{<q>}.<size> <Qd>, <Rt> // Encoded as Q = 1
VDUP{<c>}{<q>}.<size> <Dd>, <Rt> // Encoded as Q = 0
```

Decode for this encoding

```
if Q == '1' && Vd<0> == '1' then UNDEFINED;
d = UInt(D:Vd);  t = UInt(Rt);  regs = if Q == '0' then 1 else 2;
case B:E of
    when '00'  esize = 32;  elements = 2;
    when '01'  esize = 16;  elements = 4;
    when '10'  esize = 8;   elements = 8;
    when '11'  UNDEFINED;
if t == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-3660. Arm strongly recommends that any `VDUP` instruction is unconditional, see *Conditional execution* on page F2-3661.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<size>` The data size for the elements of the destination vector. It must be one of:

- `8` Encoded as [b, e] = `0b10`.
- `16` Encoded as [b, e] = `0b01`.
- `32` Encoded as [b, e] = `0b00`.

`<Qd>` The destination vector for a quadword operation.

`<Dd>` The destination vector for a doubleword operation.

`<Rt>` The Arm source register.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    scalar = R[t]<esize-1:0>;
    for r = 0 to regs-1
        for e = 0 to elements-1
            Elem[D[d+r],e,esize] = scalar;
```

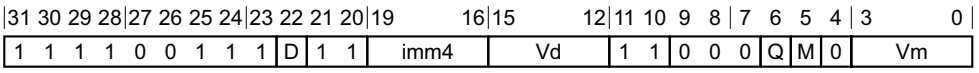
Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

F6.1.77 VDUP (scalar)



Duplicate vector element to vector duplicates a single element of a vector into every element of the destination vector.

The scalar, and the destination vector elements, can be any one of 8-bit, 16-bit, or 32-bit fields. There is no distinction between data types.

For more information about scalars see *Advanced SIMD scalars* on page F2-3686.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

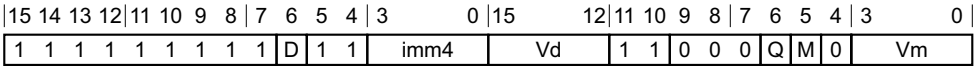
A1

Encoding

Applies when `Q == 0`.

```
VDUP{<c>}{<q>}.<size> <Dd>, <Dm[x]>
```

Encoding



Applies when `Q == 1`.

```
VDUP{<c>}{<q>}.<size> <Qd>, <Dm[x]>
```

Decode for all variants of this encoding

```
if imm4 == 'x000' then UNDEFINED;
if Q == '1' && Vd<0> == '1' then UNDEFINED;
case imm4 of
    when 'xxx1'  esize = 8;  elements = 8;  index = UInt(imm4<3:1>);
    when 'xx10'  esize = 16;  elements = 4;  index = UInt(imm4<3:2>);
    when 'x100'  esize = 32;  elements = 2;  index = UInt(imm4<3>);
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1

Encoding

Applies when `Q == 0`.

```
VDUP{<c>}{<q>}.<size> <Dd>, <Dm[x]>
```

Encoding

Applies when `Q == 1`.

```
VDUP{<c>}{<q>}.<size> <Qd>, <Dm[x]>
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Decode for all variants of this encoding

```
if imm4 == 'x000' then UNDEFINED;
if Q == '1' && Vd<0> == '1' then UNDEFINED;
case imm4 of
    when 'xxx1'  esize = 8;  elements = 8;  index = UInt(imm4<3:1>);
    when 'xx10'  esize = 16;  elements = 4;  index = UInt(imm4<3:2>);
    when 'x100'  esize = 32;  elements = 2;  index = UInt(imm4<3>);
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

Assembler symbols

`<c>` For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<size>` The data size. It must be one of:

- `8` Encoded as imm4<0> = '1'. imm4<3:1> encodes the index`[x]` of the scalar.
- `16` Encoded as imm4<1:0> = '10'. imm4<3:2> encodes the index `[x]` of the scalar.
- `32` Encoded as imm4<2:0> = '100'. imm4<3> encodes the index `[x]` of the scalar.

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

`<Dm[x]>` The scalar. For details of how `[x]` is encoded, see the description of `<size>`.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    scalar = Elem[D[m],index,esize];
    for r = 0 to regs-1
        for e = 0 to elements-1
            Elem[D[d+r],e,esize] = scalar;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

F6.1.78 VEOR

Vector Bitwise Exclusive OR performs a bitwise Exclusive OR operation between two registers, and places the result in the destination register. The operand and result registers can be quadword or doubleword. They must all be the same size.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

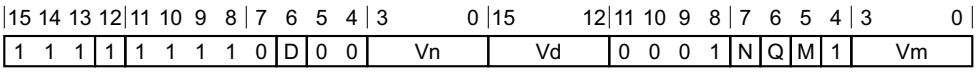
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VEOR{<c>}{<q>}{.<dt>} {<Dd>,} <Dn>, <Dm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VEOR{<c>}{<q>}{.<dt>} {<Qd>,} <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VEOR{<c>}{<q>}{.<dt>} {<Dd>,} <Dn>, <Dm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VEOR{<c>}{<q>}{.<dt>} {<Qd>,} <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<dt>` An optional data type. It is ignored by assemblers, and does not affect the encoding.

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Qn>` Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

`<Qm>` Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

`<Dn>` Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

`<Dm>` Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = D[n+r] EOR D[m+r];
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

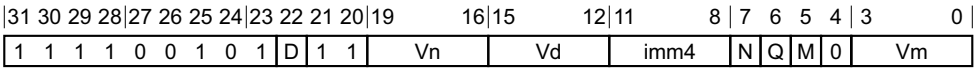
F6.1.79 VEXT (byte elements)

Vector Extract extracts elements from the bottom end of the second operand vector and the top end of the first, concatenates them and places the result in the destination vector.

The elements of the vectors are treated as being 8-bit fields. There is no distinction between data types.



The following figure shows the operation of VEXT doubleword operation for imm = 3.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

This instruction is used by the pseudo-instruction VEXT (multibyte elements). The pseudo-instruction is never the preferred disassembly.

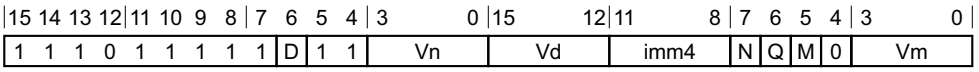
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VEXT{<c>}{<q>}.8 {<Dd>,} <Dn>, <Dm>, #<imm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VEXT{<c>}{<q>}.8 {<Qd>,} <Qn>, <Qm>, #<imm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if Q == '0' && imm4<3> == '1' then UNDEFINED;
quadword_operation = (Q == '1');  position = 8 * UInt(imm4);
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);
```

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VEXT{<c>}{<q>}.8 {<Dd>,} <Dn>, <Dm>, #<imm>
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

128-bit SIMD vector variant

Applies when Q == 1.

```
VEXT{<c>}{<q>}.8 {<Qd>,} <Qn>, <Qm>, #<imm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if Q == '0' && imm4<3> == '1' then UNDEFINED;
quadword_operation = (Q == '1');  position = 8 * UInt(imm4);
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);
```

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

<imm> For the 64-bit SIMD vector variant: is the location of the extracted result in the concatenation of the operands, as a number of bytes from the least significant end, in the range 0 to 7, encoded in the "imm4" field.

For the 128-bit SIMD vector variant: is the location of the extracted result in the concatenation of the operands, as a number of bytes from the least significant end, in the range 0 to 15, encoded in the "imm4" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    if quadword_operation then
        Q[d>>1] = (Q[m>>1]:Q[n>>1])<position+127:position>;
    else
        D[d] = (D[m]:D[n])<position+63:position>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

F6.1.80 VEXT (multibyte elements)

Vector Extract extracts elements from the bottom end of the second operand vector and the top end of the first, concatenates them and places the result in the destination vector

This instruction is a pseudo-instruction of the VEXT (byte elements) instruction. This means that:

- The encodings in this description are named to match the encodings of VEXT (byte elements).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VEXT (byte elements) gives the operational pseudocode for this instruction.

A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VEXT{<c>}{<q>}.<size> {<Dd>,} <Dn>, <Dm>, #<imm>
```

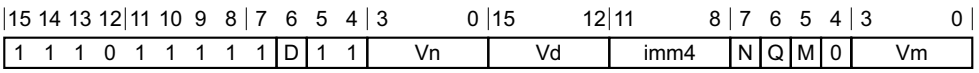
is equivalent to

```
VEXT{<c>}{<q>}.8 {<Dd>,} <Dn>, <Dm>, #<imm*(size/8)>
```

and is never the preferred disassembly.

128-bit SIMD vector variant

Applies when `Q == 1`.



```
VEXT{<c>}{<q>}.<size> {<Qd>,} <Qn>, <Qm>, #<imm>
```

is equivalent to

```
VEXT{<c>}{<q>}.8 {<Qd>,} <Qn>, <Qm>, #<imm*(size/8)>
```

and is never the preferred disassembly.

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VEXT{<c>}{<q>}.<size> {<Dd>,} <Dn>, <Dm>, #<imm>
```

is equivalent to

```
VEXT{<c>}{<q>}.8 {<Dd>,} <Dn>, <Dm>, #<imm*(size/8)>
```

and is never the preferred disassembly.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VEXT{<c>}{<q>}.<size> {<Qd>,} <Qn>, <Qm>, #<imm>
```

is equivalent to

```
VEXT{<c>}{<q>}.8 {<Qd>,} <Qn>, <Qm>, #<imm*(size/8)>
```

and is never the preferred disassembly.

Assembler symbols

`<c>` For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<size>` For the 64-bit SIMD vector variant: is the size of the operation, and can be one of 16 or 32.

For the 128-bit SIMD vector variant: is the size of the operation, and can be one of 16, 32 or 64.

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Qn>` Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

`<Qm>` Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

`<Dn>` Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

`<Dm>` Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

`<imm>` For the 64-bit SIMD vector variant: is the location of the extracted result in the concatenation of the operands, as a number of bytes from the least significant end, in the range 0 to (128/`<size>`)-1.

For the 128-bit SIMD vector variant: is the location of the extracted result in the concatenation of the operands, as a number of bytes from the least significant end, in the range 0 to (64/`<size>`)-1.

Operation for all encodings

The description of VEXT (byte elements) gives the operational pseudocode for this instruction.

F6.1.81 VFMA

Vector Fused Multiply Accumulate multiplies corresponding elements of two vectors, and accumulates the results into the elements of the destination vector. The instruction does not round the result of the multiply before the accumulation.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

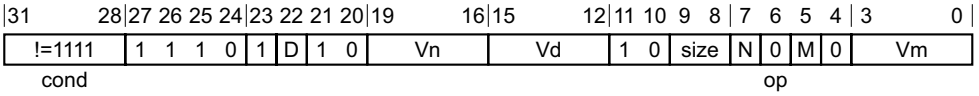
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VFMA{<c>}{<q>}.<dt> <Dd>, <Dn>, <Dm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VFMA{<c>}{<q>}.<dt> <Qd>, <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
advsimd = TRUE; op1_neg = (op == '1');
case sz of
    when '0' esize = 32; elements = 2;
    when '1' esize = 16; elements = 4;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
regs = if Q == '0' then 1 else 2;
```

A2

Half-precision scalar variant

Applies when `size == 01`.

```
VFMA{<c>}{<q>}.F16 <Sd>, <Sn>, <Sm>
```

Single-precision scalar variant

Applies when `size == 10`.

```
VFMA{<c>}{<q>}.F32 <Sd>, <Sn>, <Sm>
```

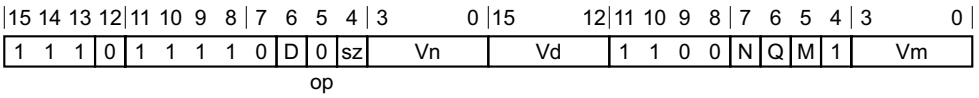
Double-precision scalar variant

Applies when `size == 11`.

```
VFMA{<c>}{<q>}.F64 <Dd>, <Dn>, <Dm>
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Decode for all variants of this encoding



```
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
if size == '01' && cond != '1110' then UNPREDICTABLE;
advsimd = FALSE; op1_neg = (op == '1');
case size of
    when '01' esize = 16; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
    when '10' esize = 32; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
    when '11' esize = 64; d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && cond != '1110'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VFMA{<c>}{<q>}.<dt> <Dd>, <Dn>, <Dm>
```

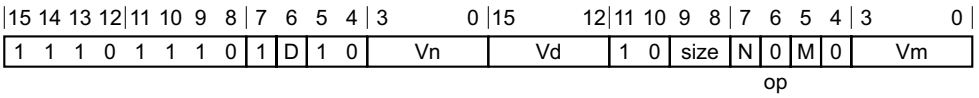
128-bit SIMD vector variant

Applies when `Q == 1`.

```
VFMA{<c>}{<q>}.<dt> <Qd>, <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
if sz == '1' && InITBlock() then UNPREDICTABLE;
advsimd = TRUE; op1_neg = (op == '1');
case sz of
    when '0' esize = 32; elements = 2;
    when '1' esize = 16; elements = 4;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
regs = if Q == '0' then 1 else 2;
```



CONSTRAINED UNPREDICTABLE behavior

If `sz == '1' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

T2

Half-precision scalar variant

Applies when `size == 01`.

```
VFMA{<c>}{<q>}.F16 <Sd>, <Sn>, <Sm>
```

Single-precision scalar variant

Applies when `size == 10`.

```
VFMA{<c>}{<q>}.F32 <Sd>, <Sn>, <Sm>
```

Double-precision scalar variant

Applies when `size == 11`.

```
VFMA{<c>}{<q>}.F64 <Dd>, <Dn>, <Dm>
```

Decode for all variants of this encoding

```
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
if size == '01' && InITBlock()  then UNPREDICTABLE;
advsimd = FALSE; op1_neg = (op == '1');
case size of
    when '01' esize = 16; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
    when '10' esize = 32; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
    when '11' esize = 64; d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

`<c>` For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding A2, T1 and T2: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<dt>` Is the data type for the elements of the vectors, encoded in the "sz" field. It can have the following values:

`F32` when `sz = 0`

`F16` when `sz = 1`

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Qn>` Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

<Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.

<Sn> Is the 32-bit name of the first SIMD&FP source register, encoded in the "Vn:N" field.

<Sm> Is the 32-bit name of the second SIMD&FP source register, encoded in the "Vm:M" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDOrVFPEnabled(TRUE, advsimd);
    if advsimd then // Advanced SIMD instruction
        for r = 0 to regs-1
            for e = 0 to elements-1
                bits(esize) op1 = Elem[D[n+r],e,esize];
                if op1_neg then op1 = FPNeg(op1);
                Elem[D[d+r],e,esize] = FPMulAdd(Elem[D[d+r],e,esize],
                                                op1, Elem[D[m+r],e,esize], StandardFPSCRValue());

    else // VFP instruction
        case esize of
            when 16
                op16 = if op1_neg then FPNeg(S[n]<15:0>) else S[n]<15:0>;
                S[d] = Zeros(16) : FPMulAdd(S[d]<15:0>, op16, S[m]<15:0>, FPSCR);
            when 32
                op32 = if op1_neg then FPNeg(S[n]) else S[n];
                S[d] = FPMulAdd(S[d], op32, S[m], FPSCR);
            when 64
                op64 = if op1_neg then FPNeg(D[n]) else D[n];
                D[d] = FPMulAdd(D[d], op64, D[m], FPSCR);
```

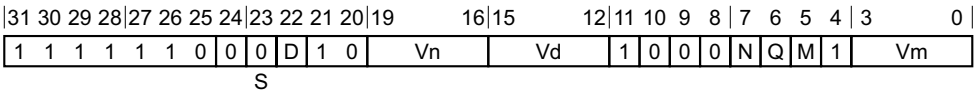
F6.1.82 VFMAL (vector)

Vector Floating-point Multiply-Add Long to accumulator (vector). This instruction multiplies corresponding values in the vectors in the two source SIMD&FP registers, and accumulates the product to the corresponding vector element of the destination SIMD&FP register. The instruction does not round the result of the multiply before the accumulation.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.



In Armv8.2 and Armv8.3, this is an OPTIONAL instruction. From Armv8.4 it is mandatory for all implementations to support it.

Note

ID_ISAR6.FHM indicates whether this instruction is supported.

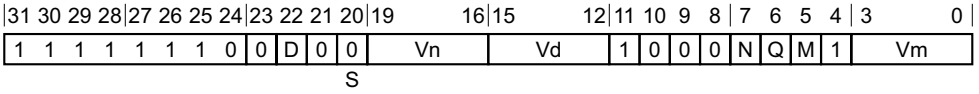
F6.1.83 VFMAL (by scalar)

Vector Floating-point Multiply-Add Long to accumulator (by scalar). This instruction multiplies the vector elements in the first source SIMD&FP register by the specified value in the second source SIMD&FP register, and accumulates the product to the corresponding vector element of the destination SIMD&FP register. The instruction does not round the result of the multiply before the accumulation.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.



In Armv8.2 and Armv8.3, this is an OPTIONAL instruction. From Armv8.4 it is mandatory for all implementations to support it.

Note

ID_ISAR6.FHM indicates whether this instruction is supported.

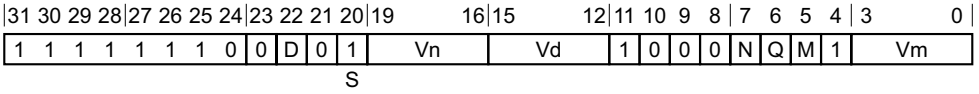
F6.1.86 VFMSL (by scalar)

Vector Floating-point Multiply-Subtract Long from accumulator (by scalar). This instruction multiplies the negated vector elements in the first source SIMD&FP register by the specified value in the second source SIMD&FP register, and accumulates the product to the corresponding vector element of the destination SIMD&FP register. The instruction does not round the result of the multiply before the accumulation.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.



In Armv8.2 and Armv8.3, this is an OPTIONAL instruction. From Armv8.4 it is mandatory for all implementations to support it.

Note

ID_ISAR6.FHM indicates whether this instruction is supported.

A1

ARMv8.2

64-bit SIMD vector variant

Applies when `Q == 0`.

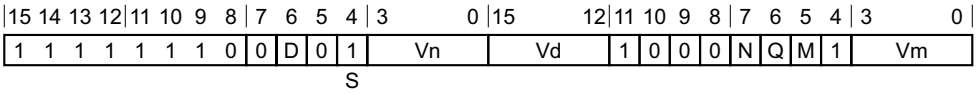
```
VFMSL{<q>}.F16 <Dd>, <Sn>, <Sm>[<index>]
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VFMSL{<q>}.F16 <Qd>, <Dn>, <Dm>[<index>]
```

Decode for all variants of this encoding



```
if !HaveFP16MulNoRoundingToFP32Ext() then UNDEFINED;
if Q == '1' && Vd<0> == '1' then UNDEFINED;

integer d = UInt(D:Vd);
integer n = if Q == '1' then UInt(N:Vn) else UInt(Vn:N);
integer m = if Q == '1' then UInt(Vm<2:0>) else UInt(Vm<2:0>:M);

F6.1.87 VFNMA

Vector Fused Negate Multiply Accumulate negates one floating-point register value and multiplies it by another floating-point register value, adds the negation of the floating-point value in the destination register to the product, and writes the result back to the destination register. The instruction does not round the result of the multiply before the addition.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1

Half-precision scalar variant

Applies when `size == 01`.

```
VFNMA{<c>}{<q>}.F16 <Sd>, <Sn>, <Sm>
```

Single-precision scalar variant

Applies when `size == 10`.

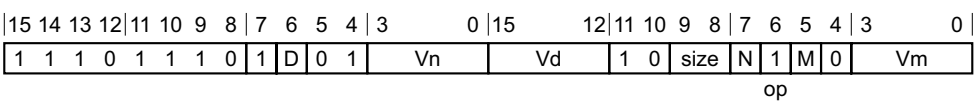
```
VFNMA{<c>}{<q>}.F32 <Sd>, <Sn>, <Sm>
```

Double-precision scalar variant

Applies when `size == 11`.

```
VFNMA{<c>}{<q>}.F64 <Dd>, <Dn>, <Dm>
```

Decode for all variants of this encoding



```
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
if size == '01' && cond != '1110' then UNPREDICTABLE;
op1_neg = (op == '1');
case size of
    when '01' esize = 16; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
    when '10' esize = 32; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
    when '11' esize = 64; d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && cond != '1110'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

```

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<dt> Is the data type for the elements of the operands, encoded in the "U:size" field. It can have the following values:

S8	when U = 0, size = 00
S16	when U = 0, size = 01
S32	when U = 0, size = 10
U8	when U = 1, size = 00
U16	when U = 1, size = 01
U32	when U = 1, size = 10

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = Int(Elem[D[n+r],e,esize], unsigned);
            op2 = Int(Elem[D[m+r],e,esize], unsigned);
            result = if add then op1+op2 else op1-op2;
            Elem[D[d+r],e,esize] = result<esize:1>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.

add = (op == '0');  unsigned = (U == '1');
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<dt> Is the data type for the elements of the operands, encoded in the "U:size" field. It can have the following values:

S8	when U = 0, size = 00
S16	when U = 0, size = 01
S32	when U = 0, size = 10
U8	when U = 1, size = 00
U16	when U = 1, size = 01
U32	when U = 1, size = 10

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = Int(Elem[D[n+r],e,esize], unsigned);
            op2 = Int(Elem[D[m+r],e,esize], unsigned);
            result = if add then op1+op2 else op1-op2;
            Elem[D[d+r],e,esize] = result<esize:1>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.

F6.1.91 VINS

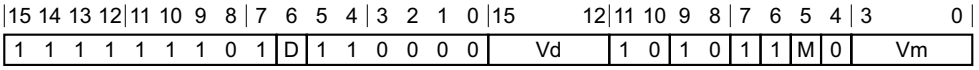
Vector move Insertion. This instruction copies the lower 16 bits of the 32-bit source SIMD&FP register into the upper 16 bits of the 32-bit destination SIMD&FP register, while preserving the values in the remaining bits.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1

ARMv8.2

A1 variant



```
VINS{<q>}.F16 <Sd>, <Sm>
```

Decode for this encoding

```
if !HaveFP16Ext() then UNDEFINED;
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
d = UInt(Vd:D); m = UInt(Vm:M);
```

T1

ARMv8.2

T1 variant

```
VINS{<q>}.F16 <Sd>, <Sm>
```

Decode for this encoding

```
if InITBlock() then UNPREDICTABLE;
if !HaveFP16Ext() then UNDEFINED;
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
d = UInt(Vd:D); m = UInt(Vm:M);
```

CONSTRAINED UNPREDICTABLE behavior

If `InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

<q> See *Standard assembler syntax fields* on page F2-3660.

<Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.

Non-Confidential

F6.1.92 VJCVT

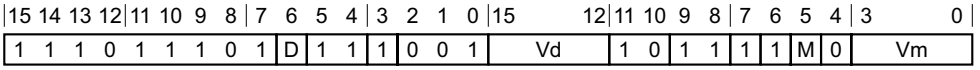
Javascript Convert to signed fixed-point, rounding toward Zero. This instruction converts the double-precision floating-point value in the SIMD&FP source register to a 32-bit signed integer using the Round towards Zero rounding mode, and writes the result to the SIMD&FP destination register. If the result is too large to be accommodated as a signed 32-bit integer, then the result is the integer modulo 2^{32}, as held in a 32-bit signed integer.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1

ARMv8.3

A1 variant



```
VJCVT{<q>}.S32.F64 <Sd>, <Dm>
```

Decode for this encoding

```
if !HaveFJCVTZSExt() then UNDEFINED;
if cond != '1110' then UNPREDICTABLE;
d = UInt(Vd:D);  m = UInt(M:Vm);
```

T1

ARMv8.3

T1 variant

```
VJCVT{<q>}.S32.F64 <Sd>, <Dm>
```

Decode for this encoding

```
if !HaveFJCVTZSExt() then UNDEFINED;
if InITBlock() then UNPREDICTABLE;
d = UInt(Vd:D);  m = UInt(M:Vm);
```

Assembler symbols

<q>	See *Standard assembler syntax fields* on page F2-3660.
<Sd>	Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.

```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> For encoding A1, A2 and A3: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1, T2 and T3: see *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<size> Is the data size, encoded in the "size" field. It can have the following values:

- 8 when size = 00
- 16 when size = 01
- 32 when size = 10

<list> Is a list containing the single 64-bit name of the SIMD&FP register holding the element.

The list must be { <Dd>[<index>] }.

The register <Dd> is encoded in the "D:Vd" field.

The permitted values and encoding of <index> depend on <size>:

- <size> == 8 <index> is in the range 0 to 7, encoded in the "index_align<3:1>" field.
- <size> == 16 <index> is in the range 0 to 3, encoded in the "index_align<3:2>" field.
- <size> == 32 <index> is 0 or 1, encoded in the "index_align<3>" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

<align> When <size> == 8, <align> must be omitted, otherwise it is the optional alignment.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Whenever <align> is omitted, the standard alignment is used, see *Unaligned data access* on page E2-3586, and the encoding depends on <size>:

<size> == 8 — Encoded in the "index_align<0>" field as 0.

<size> == 16 — Encoded in the "index_align<1:0>" field as 0b00.

<size> == 32 — Encoded in the "index_align<2:0>" field as 0b000.

Whenever <align> is present, the permitted values and encoding depend on <size>:

<size> == 16 — <align> is 16, meaning 16-bit alignment, encoded in the "index_align<1:0>" field as 0b01.

<size> == 32 — <align> is 32, meaning 32-bit alignment, encoded in the "index_align<2:0>" field as 0b011.

: is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see *The Advanced SIMD addressing mode* on page F2-3681.

<Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see *The Advanced SIMD addressing mode* on page F2-3681.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    address = R[n];  iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    Elem[D[d],index] = MemU[address,ebytes];
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + ebytes;
```

F6.1.94 VLD1 (single element to all lanes)

Load single 1-element structure and replicate to all lanes of one register loads one element from memory into every element of one or two vectors. For details of the addressing mode see *The Advanced SIMD addressing mode* on page F2-3681.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1

Offset variant

Applies when `Rm == 1111`.

```
VLD1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]
```

Post-indexed variant

Applies when `Rm == 1101`.

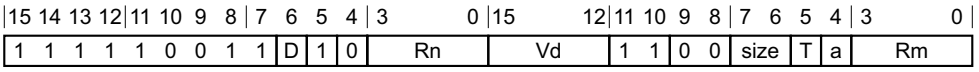
```
VLD1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!
```

Post-indexed variant

Applies when `Rm != 11x1`.

```
VLD1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}],<Rm>
```

Decode for all variants of this encoding



```
if size == '11' || (size == '00' && a == '1') then UNDEFINED;
ebytes = 1 << UInt(size);  regs = if T == '0' then 1 else 2;
alignment = if a == '0' then 1 else ebytes;
d = UInt(D:Vd);  n = UInt(Rn);  m = UInt(Rm);
wback = (m != 15);  register_index = (m != 15 && m != 13);
if n == 15 || d+regs > 32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `d+regs > 32`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

```

CONSTRAINED UNPREDICTABLE behavior

If `d+regs > 32`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VLD1 (single element to all lanes)* on page K1-7205.

Assembler symbols

`<c>` For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<size>` Is the data size, encoded in the "size" field. It can have the following values:

- `8` when `size = 00`
- `16` when `size = 01`
- `32` when `size = 10`

The encoding `size = 11` is reserved.

`<list>` Is a list containing the 64-bit names of the SIMD&FP registers.

The list must be one of:

- `{ <Dd>[] }` Encoded in the "T" field as `0`.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

`{ <Dd>[], <Dd+1>[] }` Encoded in the "T" field as `1`.

The register `<Dd>` is encoded in the "D:Vd" field.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

`<align>` When `<size>` == 8, `<align>` must be omitted, otherwise it is the optional alignment.

Whenever `<align>` is omitted, the standard alignment is used, see *Unaligned data access* on page E2-3586, and is encoded in the "a" field as `0`.

Whenever `<align>` is present, the permitted values and encoding depend on `<size>`:

`<size> == 16` `<align>` is 16, meaning 16-bit alignment, encoded in the "a" field as `1`.

`<size> == 32` `<align>` is 32, meaning 32-bit alignment, encoded in the "a" field as `1`.

`:` is the preferred separator before the `<align>` value, but the alignment can be specified as `@<align>`, see *The Advanced SIMD addressing mode* on page F2-3681.

`<Rm>` Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see *The Advanced SIMD addressing mode* on page F2-3681.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    address = R[n];  iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    bits(64) replicated_element = Replicate(MemU[address,ebytes]);
    for r = 0 to regs-1
        D[d+r] = replicated_element;
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + ebytes;
```

Applies when Rm == 1101.

```
VLD1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!
```

Post-indexed variant

Applies when Rm != 11x1.

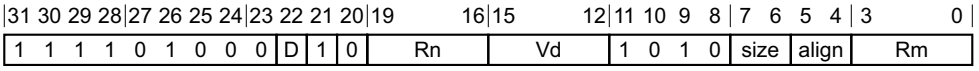
```
VLD1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>
```

Decode for all variants of this encoding



```
regs = 2;  if align == '11' then UNDEFINED;
alignment = if align == '00' then 1 else 4 << UInt(align);
ebytes = 1 << UInt(size);  elements = 8 DIV ebytes;
d = UInt(D:Vd);  n = UInt(Rn);  m = UInt(Rm);
wback = (m != 15);  register_index = (m != 15 && m != 13);
if n == 15 || d+regs > 32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If d+regs > 32, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

A3

Offset variant

Applies when Rm == 1111.

```
VLD1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]
```

Post-indexed variant

Applies when Rm == 1101.

```
VLD1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!
```

Post-indexed variant

Applies when Rm != 11x1.

```
VLD1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>
```

- The instruction executes as NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

T4

Offset variant

Applies when Rm == 1111.

```
VLD1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]
```

Post-indexed variant

Applies when Rm == 1101.

```
VLD1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!
```

Post-indexed variant

Applies when Rm != 11x1.

```
VLD1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>
```

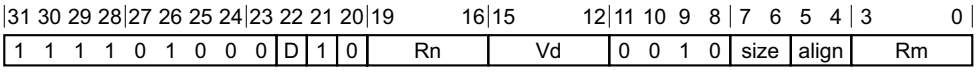
Decode for all variants of this encoding



```
regs = 4;
alignment = if align == '00' then 1 else 4 << UInt(align);
ebytes = 1 << UInt(size);  elements = 8 DIV ebytes;
d = UInt(D:Vd);  n = UInt(Rn);  m = UInt(Rm);
wback = (m != 15);  register_index = (m != 15 && m != 13);
if n == 15 || d+regs > 32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If d+regs > 32, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VLD1 (multiple single elements)* on page K1-7205.

Related encodings: See *Advanced SIMD element or structure load/store* on page F3-3736 for the T32 instruction set, or *Advanced SIMD element or structure load/store* on page F4-3811 for the A32 instruction set.

Assembler symbols

<c>	For encoding A1, A2, A3 and A4: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

For encoding T1, T2, T3 and T4: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<size>` Is the data size, encoded in the "size" field. It can have the following values:

`8` when `size = 00`

`16` when `size = 01`

`32` when `size = 10`

`64` when `size = 11`

`<list>` Is a list containing the 64-bit names of the SIMD&FP registers.

The list must be one of:

`{ <Dd> }` Single register. Selects the A1 and T1 encodings of the instruction.

`{ <Dd>, <Dd+1> }` Two single-spaced registers. Selects the A2 and T2 encodings of the instruction.

`{ <Dd>, <Dd+1>, <Dd+2> }`
Three single-spaced registers. Selects the A3 and T3 encodings of the instruction.

`{ <Dd>, <Dd+1>, <Dd+2>, <Dd+3> }`
Four single-spaced registers. Selects the A4 and T4 encodings of the instruction.

The register `<Dd>` is encoded in the "D:Vd" field.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

`<align>` Is the optional alignment.

Whenever `<align>` is omitted, the standard alignment is used, see *Unaligned data access* on page E2-3586, and is encoded in the "align" field as `0b00`.

Whenever `<align>` is present, the permitted values are:

`64` 64-bit alignment, encoded in the "align" field as `0b01`.

`128` 128-bit alignment, encoded in the "align" field as `0b10`. Available only if `<list>` contains two or four registers.

`256` 256-bit alignment, encoded in the "align" field as `0b11`. Available only if `<list>` contains four registers.

`:` is the preferred separator before the `<align>` value, but the alignment can be specified as `@<align>`, see *The Advanced SIMD addressing mode* on page F2-3681.

`<Rm>` Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see *The Advanced SIMD addressing mode* on page F2-3681.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    address = R[n];  iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    for r = 0 to regs-1
        for e = 0 to elements-1
            bits(ebytes*8) data;
            if ebytes != 8 then
                data = MemU[address,ebytes];
            else
                - = AArch32.CheckAlignment(address, ebytes, AccType_NORMAL, iswrite);
```

F6.1.96 VLD2 (single 2-element structure to one lane)

Load single 2-element structure to one lane of two registers loads one 2-element structure from memory into corresponding elements of two registers. Elements of the registers that are not loaded are unchanged. For details of the addressing mode see *The Advanced SIMD addressing mode* on page F2-3681.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1

Offset variant

Applies when `Rm == 1111`.

CONSTRAINED UNPREDICTABLE behavior

If `d2 > 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VLD2 (single 2-element structure to one lane)* on page K1-7205.

Assembler symbols

`<c>` For encoding A1, A2 and A3: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1, T2 and T3: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<size>` Is the data size, encoded in the "size" field. It can have the following values:

`8` when `size = 00`

`16` when `size = 01`

`32` when `size = 10`

`<list>` Is a list containing the 64-bit names of the two SIMD&FP registers holding the element.

The list must be one of:

`{ <Dd>[<index>], <Dd+1>[<index>] }`
Single-spaced registers, encoded as "spacing" = `0`.

`{ <Dd>[<index>], <Dd+2>[<index>] }`
Double-spaced registers, encoded as "spacing" = `1`. Not permitted when `<size>` == 8.

The encoding of "spacing" depends on `<size>`:

`<size> == 16` "spacing" is encoded in the "index_align<1>" field.

`<size> == 32` "spacing" is encoded in the "index_align<2>" field.

The register `<Dd>` is encoded in the "D:Vd" field.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

The permitted values and encoding of <index> depend on <size>:

<size> == 8	<index> is in the range 0 to 7, encoded in the "index_align<3:1>" field.
<size> == 16	<index> is in the range 0 to 3, encoded in the "index_align<3:2>" field.
<size> == 32	<index> is 0 or 1, encoded in the "index_align<3>" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

<align> Is the optional alignment.

Whenever <align> is omitted, the standard alignment is used, see *Unaligned data access* on page E2-3586, and the encoding depends on <size>:

<size> == 8	Encoded in the "index_align<0>" field as 0.
<size> == 16	Encoded in the "index_align<0>" field as 0.
<size> == 32	Encoded in the "index_align<1:0>" field as 0b00.

Whenever <align> is present, the permitted values and encoding depend on <size>:

<size> == 8	<align> is 16, meaning 16-bit alignment, encoded in the "index_align<0>" field as 1.
<size> == 16	<align> is 32, meaning 32-bit alignment, encoded in the "index_align<0>" field as 1.
<size> == 32	<align> is 64, meaning 64-bit alignment, encoded in the "index_align<1:0>" field as 0b01.

: is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see *The Advanced SIMD addressing mode* on page F2-3681.

<Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see *The Advanced SIMD addressing mode* on page F2-3681.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    address = R[n];  iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    Elem[D[d], index] = MemU[address,ebytes];
    Elem[D[d2],index] = MemU[address+ebytes,ebytes];
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 2*ebytes;
```

F6.1.97 VLD2 (single 2-element structure to all lanes)

Load single 2-element structure and replicate to all lanes of two registers loads one 2-element structure from memory into all lanes of two registers. For details of the addressing mode see *The Advanced SIMD addressing mode* on page F2-3681.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1

Offset variant

Applies when `Rm == 1111`.

```
VLD2{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]
```

Post-indexed variant

Applies when `Rm == 1101`.

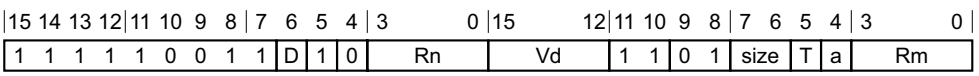
```
VLD2{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!
```

Post-indexed variant

Applies when `Rm != 11x1`.

```
VLD2{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}],<Rm>
```

Decode for all variants of this encoding



```
if size == '11' then UNDEFINED;
ebytes = 1 << UInt(size);
alignment = if a == '0' then 1 else 2*ebytes;
inc = if T == '0' then 1 else 2;
d = UInt(D:Vd);  d2 = d + inc;  n = UInt(Rn);  m = UInt(Rm);
wback = (m != 15);  register_index = (m != 15 && m != 13);
if n == 15 || d2 > 31 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `d2 > 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VLD2 (single 2-element structure to all lanes)* on page K1-7206.

Assembler symbols

`<c>` For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<size>` Is the data size, encoded in the "size" field. It can have the following values:

`8` when `size = 00`

`16` when `size = 01`

`32` when `size = 10`

The encoding `size = 11` is reserved.

`<list>` Is a list containing the 64-bit names of two SIMD&FP registers.

The list must be one of:

`{ <Dd>[], <Dd+1>[] }` Single-spaced registers, encoded in the "T" field as `0`.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

`{ <Dd>[], <Dd+2>[] }` Double-spaced registers, encoded in the "T" field as `1`.

The register `<Dd>` is encoded in the "D:Vd" field.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

`<align>` Is the optional alignment.

Whenever `<align>` is omitted, the standard alignment is used, see *Unaligned data access* on page E2-3586, and is encoded in the "a" field as `0`.

Whenever `<align>` is present, the permitted values and encoding depend on `<size>`:

`<size> == 8` `<align>` is 16, meaning 16-bit alignment, encoded in the "a" field as `1`.

`<size> == 16` `<align>` is 32, meaning 32-bit alignment, encoded in the "a" field as `1`.

`<size> == 32` `<align>` is 64, meaning 64-bit alignment, encoded in the "a" field as `1`.

`:` is the preferred separator before the `<align>` value, but the alignment can be specified as `@<align>`, see *The Advanced SIMD addressing mode* on page F2-3681.

`<Rm>` Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see *The Advanced SIMD addressing mode* on page F2-3681.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    address = R[n];  iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    D[d] = Replicate(MemU[address,ebytes]);
    D[d2] = Replicate(MemU[address+ebytes,ebytes]);
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 2*ebytes;
```

F6.1.98 VLD2 (multiple 2-element structures)

Load multiple 2-element structures to two or four registers loads multiple 2-element structures from memory into two or four registers, with de-interleaving. For more information, see *Element and structure load/store instructions* on page F1-3640. Every element of each register is loaded. For details of the addressing mode see *The Advanced SIMD addressing mode* on page F2-3681.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

CONSTRAINED UNPREDICTABLE behavior

If `d2+regs > 32`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VLD2 (multiple 2-element structures)* on page K1-7205.

Related encodings: See *Advanced SIMD element or structure load/store* on page F3-3736 for the T32 instruction set, or *Advanced SIMD element or structure load/store* on page F4-3811 for the A32 instruction set.

Assembler symbols

`<c>` For encoding A1 and A2: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1 and T2: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<size>` Is the data size, encoded in the "size" field. It can have the following values:

`8` when `size = 00`

`16` when `size = 01`

`32` when `size = 10`

The encoding `size = 11` is reserved.

`<list>` Is a list containing the 64-bit names of the SIMD&FP registers.

The list must be one of:

`{ <Dd>, <Dd+1> }` Two single-spaced registers. Selects the A1 and T1 encodings of the instruction, and encoded in the "itype" field as `0b1000`.

`{ <Dd>, <Dd+2> }` Two double-spaced registers. Selects the A1 and T1 encodings of the instruction, and encoded in the "itype" field as `0b1001`.

`{ <Dd>, <Dd+1>, <Dd+2>, <Dd+3> }`
Three single-spaced registers. Selects the A2 and T2 encodings of the instruction.

The register `<Dd>` is encoded in the "D:Vd" field.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

`<align>` Is the optional alignment.

Whenever `<align>` is omitted, the standard alignment is used, see *Unaligned data access* on page E2-3586, and is encoded in the "align" field as `0b00`.

Whenever `<align>` is present, the permitted values are:

`64` 64-bit alignment, encoded in the "align" field as `0b01`.

`128` 128-bit alignment, encoded in the "align" field as `0b10`.

`256` 256-bit alignment, encoded in the "align" field as `0b11`. Available only if `<list>` contains four registers.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

: is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see *The Advanced SIMD addressing mode* on page F2-3681.

<Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see *The Advanced SIMD addressing mode* on page F2-3681.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    address = R[n];  iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    for r = 0 to regs-1
        for e = 0 to elements-1
            Elem[D[d+r], e] = MemU[address,ebytes];
            Elem[D[d2+r],e] = MemU[address+ebytes,ebytes];
            address = address + 2*ebytes;
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 16*regs;
```

if index_align<1:0> != '00' then UNDEFINED;
ebytes = 4;  index = UInt(index_align<3>);
inc = if index_align<2> == '0' then 1 else 2;
d = UInt(D:Vd);  d2 = d + inc;  d3 = d2 + inc;  n = UInt(Rn);  m = UInt(Rm);
wback = (m != 15);  register_index = (m != 15 && m != 13);
if n == 15 || d3 > 31 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `d3 > 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VLD3 (single 3-element structure to one lane)* on page K1-7206.

Assembler symbols

`<c>` For encoding A1, A2 and A3: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1, T2 and T3: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<size>` Is the data size, encoded in the "size" field. It can have the following values:

`8` when `size = 00`

`16` when `size = 01`

`32` when `size = 10`

`<list>` Is a list containing the 64-bit names of the three SIMD&FP registers holding the element.

The list must be one of:

`{ <Dd>[<index>], <Dd+1>[<index>], <Dd+2>[<index>] }`
Single-spaced registers, encoded as "spacing" = `0`.

`{ <Dd>[<index>], <Dd+2>[<index>], <Dd+4>[<index>] }`
Double-spaced registers, encoded as "spacing" = `1`. Not permitted when `<size>` == 8.

The encoding of "spacing" depends on `<size>`:

`<size> == 8` "spacing" is encoded in the "index_align<0>" field.

`<size> == 16` "spacing" is encoded in the "index_align<1>" field, and "index_align<0>" is set to `0`.

`<size> == 32` "spacing" is encoded in the "index_align<2>" field, and "index_align<1:0>" is set to `0b00`.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

The register <Dd> is encoded in the "D:Vd" field.

The permitted values and encoding of <index> depend on <size>:

<size> == 8	<index> is in the range 0 to 7, encoded in the "index_align<3:1>" field.
<size> == 16	<index> is in the range 0 to 3, encoded in the "index_align<3:2>" field.
<size> == 32	<index> is 0 or 1, encoded in the "index_align<3>" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

<Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see *The Advanced SIMD addressing mode* on page F2-3681.

Alignment

Standard alignment rules apply, see *Alignment support* on page B2-116.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    address = R[n];
    Elem[D[d], index] = MemU[address,ebytes];
    Elem[D[d2],index] = MemU[address+ebytes,ebytes];
    Elem[D[d3],index] = MemU[address+2*ebytes,ebytes];
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 3*ebytes;
```

F6.1.100 VLD3 (single 3-element structure to all lanes)

Load single 3-element structure and replicate to all lanes of three registers loads one 3-element structure from memory into all lanes of three registers. For details of the addressing mode see *The Advanced SIMD addressing mode* on page F2-3681.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1

Offset variant

Applies when `Rm == 1111`.

```
VLD3{<c>}{<q>}.<size> <list>, [<Rn>]
```

Post-indexed variant

Applies when `Rm == 1101`.

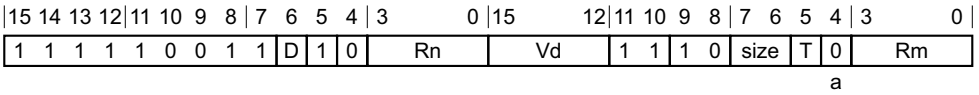
```
VLD3{<c>}{<q>}.<size> <list>, [<Rn>]!
```

Post-indexed variant

Applies when `Rm != 11x1`.

```
VLD3{<c>}{<q>}.<size> <list>, [<Rn>], <Rm>
```

Decode for all variants of this encoding



```
if size == '11' || a == '1' then UNDEFINED;
ebytes = 1 << UInt(size);
inc = if T == '0' then 1 else 2;
d = UInt(D:Vd);  d2 = d + inc;  d3 = d2 + inc;  n = UInt(Rn);  m = UInt(Rm);
wback = (m != 15);  register_index = (m != 15 && m != 13);
if n == 15 || d3 > 31 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `d3 > 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<size> Is the data size, encoded in the "size" field. It can have the following values:

8 when size = 00

16 when size = 01

32 when size = 10

The encoding size = 11 is reserved.

<list> Is a list containing the 64-bit names of the SIMD&FP registers.

The list must be one of:

{ <Dd>, <Dd+1>, <Dd+2> }
Single-spaced registers, encoded in the "itype" field as 0b0100.

{ <Dd>, <Dd+2>, <Dd+4> }
Double-spaced registers, encoded in the "itype" field as 0b0101.

The register <Dd> is encoded in the "D:Vd" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

<align> Is the optional alignment.

Whenever <align> is omitted, the standard alignment is used, see *Unaligned data access* on page E2-3586, and is encoded in the "align" field as 0b00.

Whenever <align> is present, the only permitted values is 64, meaning 64-bit alignment, encoded in the "align" field as 0b01.

: is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see *The Advanced SIMD addressing mode* on page F2-3681.

<Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about <Rn>, !, and <Rm>, see *The Advanced SIMD addressing mode* on page F2-3681.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    address = R[n];  iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    for e = 0 to elements-1
        Elem[D[d], e] = MemU[address,ebytes];
        Elem[D[d2],e] = MemU[address+ebytes,ebytes];
        Elem[D[d3],e] = MemU[address+2*ebytes,ebytes];
        address = address + 3*ebytes;
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 24;
```

d = UInt(D:Vd);  d2 = d + inc;  d3 = d2 + inc;  d4 = d3 + inc;  n = UInt(Rn);  m = UInt(Rm);
wback = (m != 15);  register_index = (m != 15 && m != 13);
if n == 15 || d4 > 31 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `d4 > 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VLD4 (single 4-element structure to one lane)* on page K1-7206.

Assembler symbols

`<c>` For encoding A1, A2 and A3: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1, T2 and T3: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<size>` Is the data size, encoded in the "size" field. It can have the following values:

`8` when `size = 00`

`16` when `size = 01`

`32` when `size = 10`

`<list>` Is a list containing the 64-bit names of the four SIMD&FP registers holding the element.

The list must be one of:

`{ <Dd>[<index>], <Dd+1>[<index>], <Dd+2>[<index>], <Dd+3>[<index>] }`
Single-spaced registers, encoded as "spacing" = `0`.

`{ <Dd>[<index>], <Dd+2>[<index>], <Dd+4>[<index>], <Dd+6>[<index>] }`
Double-spaced registers, encoded as "spacing" = `1`. Not permitted when `<size>` == 8.

The encoding of "spacing" depends on `<size>`:

`<size> == 16` "spacing" is encoded in the "index_align<1>" field.

`<size> == 32` "spacing" is encoded in the "index_align<2>" field.

The register `<Dd>` is encoded in the "D:Vd" field.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

The permitted values and encoding of <index> depend on <size>:

<size> == 8<index> is in the range 0 to 7, encoded in the "index_align<3:1>" field.

<size> == 16<index> is in the range 0 to 3, encoded in the "index_align<3:2>" field.

<size> == 32<index> is 0 or 1, encoded in the "index_align<3>" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

<align> Is the optional alignment.

Whenever <align> is omitted, the standard alignment is used, see *Unaligned data access* on page E2-3586, and the encoding depends on <size>:

<size> == 8 Encoded in the "index_align<0>" field as 0.

<size> == 16 Encoded in the "index_align<0>" field as 0.

<size> == 32 Encoded in the "index_align<1:0>" field as 0b00.

Whenever <align> is present, the permitted values and encoding depend on <size>:

<size> == 8 <align> is 32, meaning 32-bit alignment, encoded in the "index_align<0>" field as 1.

<size> == 16 <align> is 64, meaning 64-bit alignment, encoded in the "index_align<0>" field as 1.

<size> == 32 <align> can be 64 or 128. 64-bit alignment is encoded in the "index_align<1:0>" field as 0b01, and 128-bit alignment is encoded in the "index_align<1:0>" field as 0b10.

: is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see *The Advanced SIMD addressing mode* on page F2-3681.

<Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see *The Advanced SIMD addressing mode* on page F2-3681.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    address = R[n];  iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    Elem[D[d], index] = MemU[address,ebytes];
    Elem[D[d2],index] = MemU[address+ebytes,ebytes];
    Elem[D[d3],index] = MemU[address+2*ebytes,ebytes];
    Elem[D[d4],index] = MemU[address+3*ebytes,ebytes];
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 4*ebytes;
```

F6.1.103 VLD4 (single 4-element structure to all lanes)

Load single 4-element structure and replicate to all lanes of four registers loads one 4-element structure from memory into all lanes of four registers. For details of the addressing mode see *The Advanced SIMD addressing mode* on page F2-3681.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1

Offset variant

Applies when `Rm == 1111`.

```
VLD4{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]
```

Post-indexed variant

Applies when `Rm == 1101`.

```
VLD4{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!
```

Post-indexed variant

Applies when `Rm != 11x1`.

```
VLD4{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}],<Rm>
```

Decode for all variants of this encoding

```
if size == '11' && a == '0' then UNDEFINED;

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<size> Is the data size, encoded in the "size" field. It can have the following values:

8 when size = 00

16 when size = 01

32 when size = 10

The encoding size = 11 is reserved.

<list> Is a list containing the 64-bit names of the SIMD&FP registers.

The list must be one of:

{ <Dd>, <Dd+1>, <Dd+2>, <Dd+3> }
Single-spaced registers, encoded in the "itype" field as 0b0000.

{ <Dd>, <Dd+2>, <Dd+4>, <Dd+6> }
Double-spaced registers, encoded in the "itype" field as 0b0001.

The register <Dd> is encoded in the "D:Vd" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

<align> Is the optional alignment.

Whenever <align> is omitted, the standard alignment is used, see *Unaligned data access* on page E2-3586, and is encoded in the "align" field as 0b00.

Whenever <align> is present, the permitted values are:

64 64-bit alignment, encoded in the "align" field as 0b01.

128 128-bit alignment, encoded in the "align" field as 0b10.

256 256-bit alignment, encoded in the "align" field as 0b11.

: is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see *The Advanced SIMD addressing mode* on page F2-3681.

<Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see *The Advanced SIMD addressing mode* on page F2-3681.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    address = R[n];  iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    for e = 0 to elements-1
        Elem[D[d], e] = MemU[address,ebytes];
        Elem[D[d2],e] = MemU[address+ebytes,ebytes];
        Elem[D[d3],e] = MemU[address+2*ebytes,ebytes];
        Elem[D[d4],e] = MemU[address+3*ebytes,ebytes];
        address = address + 4*ebytes;
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 32;
```

F6.1.105 VLDM, VLDMDB, VLDMIA

Load Multiple SIMD&FP registers loads multiple registers from consecutive locations in the Advanced SIMD and floating-point register file using an address from a general-purpose register.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

This instruction is used by the alias VPOP. See *Alias conditions* on page F6-4820 for details of when each alias is preferred.

A1

Decrement Before variant

Applies when `P == 1 && U == 0 && W == 1`.

```
VLDMDB{<c>}{<q>}{.<size>} <Rn>!, <dreglist>
```

Increment After variant

Applies when `P == 0 && U == 1`.

```
VLDM{<c>}{<q>}{.<size>} <Rn>{!}, <dreglist>
VLDMIA{<c>}{<q>}{.<size>} <Rn>{!}, <dreglist>

```
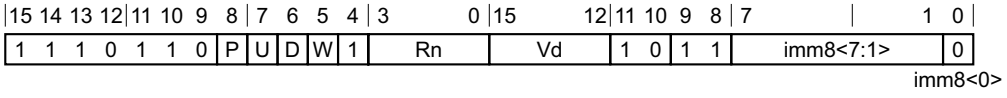
imm32 = ZeroExtend(imm8:'00', 32);  regs = UInt(imm8);
if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
if regs == 0 || (d+regs) > 32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior



If `regs == 0`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction operates as a `VLDM` with the same addressing mode but loads no registers.

If `(d+regs) > 32`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VLDM* on page K1-7207.

Related encodings: See *Advanced SIMD and floating-point 64-bit move* on page F3-3723 for the T32 instruction set, or *Advanced SIMD and floating-point 64-bit move* on page F4-3794 for the A32 instruction set.

Alias conditions

Alias	is preferred when
VPOP	`P == '0' && U == '1' && W == '1' && Rn == '1101'`

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<size>` An optional data size specifier. If present, it must be equal to the size in bits, 32 or 64, of the registers being transferred.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field. If writeback is not specified, the PC can be used.

`!` Specifies base register writeback. Encoded in the "W" field as 1 if present, otherwise 0.

`<sreglist>` Is the list of consecutively numbered 32-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "Vd:D", and "imm8" is set to the number of registers in the list. The list must contain at least one register.

`<dreglist>` Is the list of consecutively numbered 64-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "D:Vd", and "imm8" is set to twice the number of registers in the list. The list must contain at least one register, and must not contain more than 16 registers.

F6.1.106 VLDR (immediate)

Load SIMD&FP register (immediate) loads a single register from the Advanced SIMD and floating-point register file, using an address from a general-purpose register, with an optional offset.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1

Half-precision scalar variant

Applies when `size == 01`.

```
VLDR{<c>}{<q>}.16 <Sd>, [<Rn> {, #{+/-}<imm>}]
```

Single-precision scalar variant

Applies when `size == 10`.

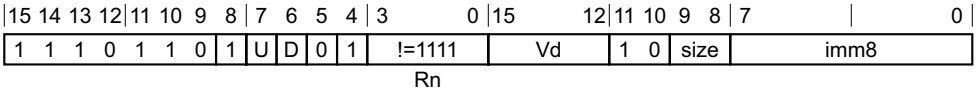
```
VLDR{<c>}{<q>}{.32} <Sd>, [<Rn> {, #{+/-}<imm>}]
```

Double-precision scalar variant

Applies when `size == 11`.

```
VLDR{<c>}{<q>}{.64} <Dd>, [<Rn> {, #{+/-}<imm>}]
```

Decode for all variants of this encoding



```
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
if size == '01' && cond != '1110' then UNPREDICTABLE;
esize = 8 << UInt(size);  add = (U == '1');
imm32 = if esize == 16 then ZeroExtend(imm8:'0', 32) else ZeroExtend(imm8:'00', 32);
case size of
    when '01' d = UInt(Vd:D);
    when '10' d = UInt(Vd:D);
    when '11' d = UInt(D:Vd);
n = UInt(Rn);
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && cond != '1110'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

<label> The label of the literal data item to be loaded.

For the single-precision scalar or double-precision scalar variants: the assembler calculates the required value of the offset from the Align(PC, 4) value of the instruction to this label. Permitted values are multiples of 4 in the range -1020 to 1020.

For the half-precision scalar variant: the assembler calculates the required value of the offset from the Align(PC, 4) value of the instruction to this label. Permitted values are multiples of 2 in the range -510 to 510.

If the offset is zero or positive, `imm32` is equal to the offset and `add` == `TRUE`.

If the offset is negative, `imm32` is equal to minus the offset and `add` == `FALSE`.

+/- Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when `U = 0`
- + when `U = 1`

<imm> For the single-precision scalar or double-precision scalar variants: is the optional unsigned immediate byte offset, a multiple of 4, in the range 0 to 1020, defaulting to 0, and encoded in the "imm8" field as <imm>/4.

For the half-precision scalar variant: is the optional unsigned immediate byte offset, a multiple of 2, in the range 0 to 510, defaulting to 0, and encoded in the "imm8" field as <imm>/2.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see *Use of labels in UAL instruction syntax* on page F1-3619.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckVFPEnabled(TRUE);
    base = if n == 15 then Align(PC,4) else R[n];
    address = if add then (base + imm32) else (base - imm32);
    case esize of
        when 16
            S[d] = Zeros(16) : MemA[address,2];
        when 32
            S[d] = MemA[address,4];
        when 64
            word1 = MemA[address,4];  word2 = MemA[address+4,4];
            // Combine the word-aligned words in the correct order for current endianness.
            D[d] = if BigEndian() then word1:word2 else word2:word1;
```

Non-Confidential

```
maximum = (op == '0');
case sz of
    when '0' esize = 32; elements = 2;
    when '1' esize = 16; elements = 4;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

CONSTRAINED UNPREDICTABLE behavior

If `sz == '1' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

`<c>` For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<dt>` Is the data type for the elements of the vectors, encoded in the "sz" field. It can have the following values:

`F32` when `sz = 0`

`F16` when `sz = 1`

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Qn>` Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

`<Qm>` Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

`<Dn>` Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

`<Dm>` Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Floating-point maximum and minimum

- max(+0.0, -0.0) = +0.0
- If any input is a NaN, the corresponding result element is the default NaN.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = Elem[D[n+r],e,esize];  op2 = Elem[D[m+r],e,esize];
            if maximum then
                Elem[D[d+r],e,esize] = FPMax(op1, op2, StandardFPSCRValue());
            else
                Elem[D[d+r],e,esize] = FPMin(op1, op2, StandardFPSCRValue());
```

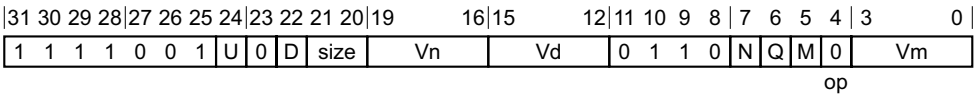
F6.1.109 VMAX (integer)

Vector Maximum compares corresponding elements in two vectors, and copies the larger of each pair into the corresponding element in the destination vector.



The operand vector elements can be any one of:

- 8-bit, 16-bit, or 32-bit signed integers.
- 8-bit, 16-bit, or 32-bit unsigned integers.

The result vector elements are the same size as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

F6.1.110 VMAXNM

This instruction determines the floating-point maximum number.

It handles NaNs in consistence with the IEEE754-2008 specification. It returns the numerical operand when one operand is numerical and the other is a quiet NaN, but otherwise the result is identical to floating-point VMAX.

This instruction is not conditional.

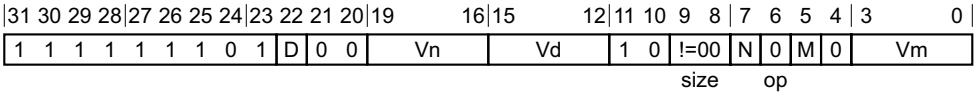
A1

64-bit SIMD vector variant

Applies when Q == 0.

```
VMAXNM{<q>}.<dt> <Dd>, <Dn>, <Dm>
```

128-bit SIMD vector variant



Applies when Q == 1.

```
VMAXNM{<q>}.<dt> <Qd>, <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
maximum = (op == '0');
advsimd = TRUE;
case sz of
    when '0' esize = 32; elements = 2;
    when '1' esize = 16; elements = 4;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
```

A2

Half-precision scalar variant

Applies when size == 01.

```
VMAXNM{<q>}.F16 <Sd>, <Sn>, <Sm> // Cannot be conditional
```

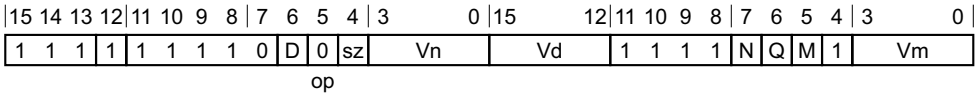
Single-precision scalar variant

Applies when size == 10.

```
VMAXNM{<q>}.F32 <Sd>, <Sn>, <Sm> // Cannot be conditional
```

Double-precision scalar variant

Applies when size == 11.



```
VMAXNM{<q>}.F64 <Dd>, <Dn>, <Dm> // Cannot be conditional
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Decode for all variants of this encoding

```
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
advsimd = FALSE;
maximum = (op == '0');
case size of
    when '01' esize = 16; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
    when '10' esize = 32; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
    when '11' esize = 64; d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
```

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

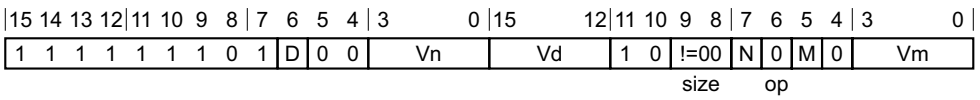
```
VMAXNM{<q>}.<dt> <Dd>, <Dn>, <Dm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VMAXNM{<q>}.<dt> <Qd>, <Qn>, <Qm>
```

Decode for all variants of this encoding



```
if InITBlock() then UNPREDICTABLE;
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
maximum = (op == '0');
advsimd = TRUE;
case sz of
    when '0' esize = 32; elements = 2;
    when '1' esize = 16; elements = 4;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
```

CONSTRAINED UNPREDICTABLE behavior

If `InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

T2

Half-precision scalar variant

Applies when `size == 01`.

```
VMAXNM{<q>}.F16 <Sd>, <Sn>, <Sm> // Not permitted in IT block
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Single-precision scalar variant

Applies when `size == 10`.

```
VMAXNM{<q>}.F32 <Sd>, <Sn>, <Sm> // Not permitted in IT block
```

Double-precision scalar variant

Applies when `size == 11`.

```
VMAXNM{<q>}.F64 <Dd>, <Dn>, <Dm> // Not permitted in IT block
```

Decode for all variants of this encoding

```
if InITBlock() then UNPREDICTABLE;
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
advsimd = FALSE;
maximum = (op == '0');
case size of
    when '01' esize = 16; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
    when '10' esize = 32; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
    when '11' esize = 64; d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
```

CONSTRAINED UNPREDICTABLE behavior

If `InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<dt>` Is the data type for the elements of the vectors, encoded in the "sz" field. It can have the following values:

`F32`	when `sz = 0`
`F16`	when `sz = 1`

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Qn>` Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

`<Qm>` Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

`<Dn>` Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

`<Dm>` Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

`<Sd>` Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.

`<Sn>` Is the 32-bit name of the first SIMD&FP source register, encoded in the "Vn:N" field.

`<Sm>` Is the 32-bit name of the second SIMD&FP source register, encoded in the "Vm:M" field.

F6.1.111 VMIN (floating-point)

Vector Minimum compares corresponding elements in two vectors, and copies the smaller of each pair into the corresponding element in the destination vector.

The operand vector elements are floating-point numbers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

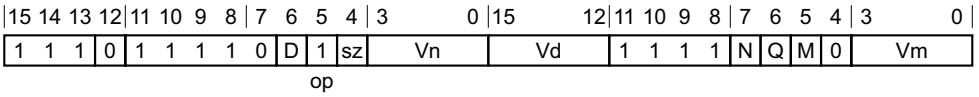
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VMIN{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VMIN{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
maximum = (op == '0');
case sz of
    when '0' esize = 32; elements = 2;
    when '1' esize = 16; elements = 4;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VMIN{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VMIN{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
if sz == '1' && InITBlock() then UNPREDICTABLE;
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

```
maximum = (op == '0');
case sz of
    when '0' esize = 32; elements = 2;
    when '1' esize = 16; elements = 4;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

CONSTRAINED UNPREDICTABLE behavior

If `sz == '1' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

`<c>` For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<dt>` Is the data type for the elements of the vectors, encoded in the "sz" field. It can have the following values:

`F32` when `sz = 0`

`F16` when `sz = 1`

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Qn>` Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

`<Qm>` Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

`<Dn>` Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

`<Dm>` Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Floating-point minimum

- min(+0.0, -0.0) = -0.0
- If any input is a NaN, the corresponding result element is the default NaN.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = Elem[D[n+r],e,esize];  op2 = Elem[D[m+r],e,esize];
            if maximum then
                Elem[D[d+r],e,esize] = FPMax(op1, op2, StandardFPSCRValue());
            else
                Elem[D[d+r],e,esize] = FPMin(op1, op2, StandardFPSCRValue());
```

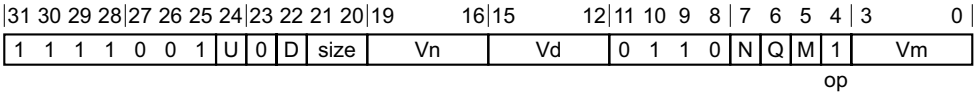
F6.1.112 VMIN (integer)

Vector Minimum compares corresponding elements in two vectors, and copies the smaller of each pair into the corresponding element in the destination vector.



The operand vector elements can be any one of:

- 8-bit, 16-bit, or 32-bit signed integers.
- 8-bit, 16-bit, or 32-bit unsigned integers.

The result vector elements are the same size as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

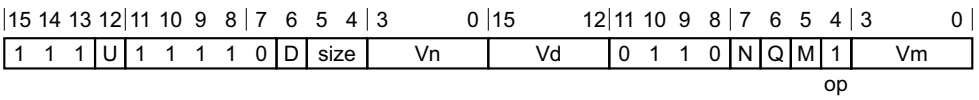
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VMIN{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VMIN{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if size == '11' then UNDEFINED;
maximum = (op == '0');  unsigned = (U == '1');
esize = 8 << UInt(size);  elements = 64 DIV esize;

F6.1.113 VMINNM

This instruction determines the floating point minimum number.

It handles NaNs in consistence with the IEEE754-2008 specification. It returns the numerical operand when one operand is numerical and the other is a quiet NaN, but otherwise the result is identical to floating-point `VMIN`.

This instruction is not conditional.

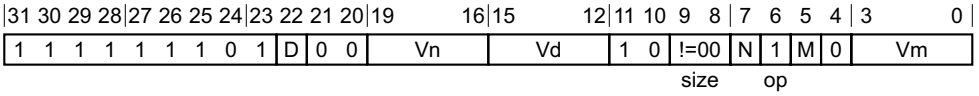
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VMINNM{<q>}.<dt> <Dd>, <Dn>, <Dm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VMINNM{<q>}.<dt> <Qd>, <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
maximum = (op == '0');
advsimd = TRUE;
case sz of
    when '0' esize = 32; elements = 2;
    when '1' esize = 16; elements = 4;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
```

A2

Half-precision scalar variant

Applies when `size == 01`.

```
VMINNM{<q>}.F16 <Sd>, <Sn>, <Sm> // Cannot be conditional
```

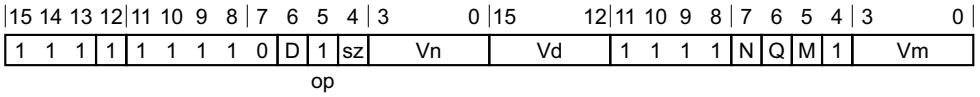
Single-precision scalar variant

Applies when `size == 10`.

```
VMINNM{<q>}.F32 <Sd>, <Sn>, <Sm> // Cannot be conditional
```

Double-precision scalar variant

Applies when `size == 11`.



```
VMINNM{<q>}.F64 <Dd>, <Dn>, <Dm> // Cannot be conditional
```

Decode for all variants of this encoding

```
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
advsimd = FALSE;
maximum = (op == '0');
case size of
    when '01' esize = 16; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
    when '10' esize = 32; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
    when '11' esize = 64; d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
```

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

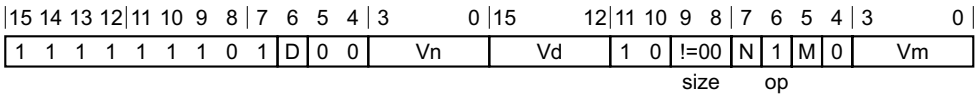
```
VMINNM{<q>}.<dt> <Dd>, <Dn>, <Dm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VMINNM{<q>}.<dt> <Qd>, <Qn>, <Qm>
```

Decode for all variants of this encoding



```
if InITBlock() then UNPREDICTABLE;
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
maximum = (op == '0');
advsimd = TRUE;
case sz of
    when '0' esize = 32; elements = 2;
    when '1' esize = 16; elements = 4;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
```

CONSTRAINED UNPREDICTABLE behavior

If `InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

T2

Half-precision scalar variant

Applies when `size == 01`.

F6.1.114 VMLA (floating-point)

Vector Multiply Accumulate multiplies corresponding elements in two vectors, and accumulates the results into the elements of the destination vector.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

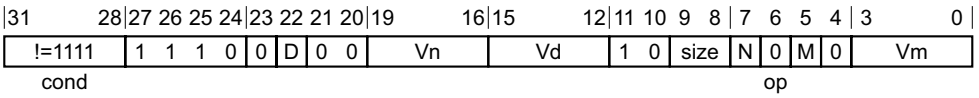
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VMLA{<c>}{<q>}.<dt> <Dd>, <Dn>, <Dm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VMLA{<c>}{<q>}.<dt> <Qd>, <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
advsimd = TRUE;  add = (op == '0');
case sz of
    when '0' esize = 32; elements = 2;
    when '1' esize = 16; elements = 4;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

A2

Half-precision scalar variant

Applies when `size == 01`.

```
VMLA{<c>}{<q>}.F16 <Sd>, <Sn>, <Sm>
```

Single-precision scalar variant

Applies when `size == 10`.

```
VMLA{<c>}{<q>}.F32 <Sd>, <Sn>, <Sm>
```

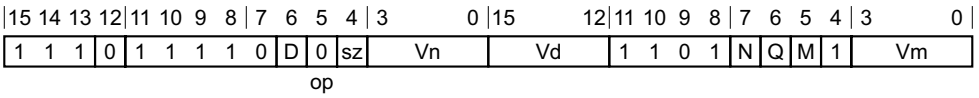
Double-precision scalar variant

Applies when `size == 11`.

```
VMLA{<c>}{<q>}.F64 <Dd>, <Dn>, <Dm>
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Decode for all variants of this encoding



```
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
if size == '01' && cond != '1110' then UNPREDICTABLE;
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
advsimd = FALSE; add = (op == '0');
case size of
    when '01' esize = 16; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
    when '10' esize = 32; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
    when '11' esize = 64; d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && cond != '1110'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VMLA{<c>}{<q>}.<dt> <Dd>, <Dn>, <Dm>
```

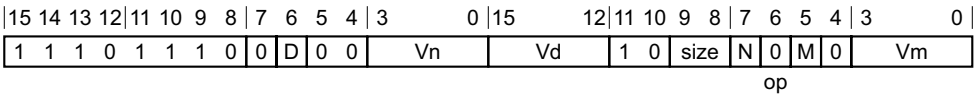
128-bit SIMD vector variant

Applies when `Q == 1`.

```
VMLA{<c>}{<q>}.<dt> <Qd>, <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
if sz == '1' && InITBlock() then UNPREDICTABLE;
advsimd = TRUE;  add = (op == '0');
case sz of
    when '0' esize = 32; elements = 2;
    when '1' esize = 16; elements = 4;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```



CONSTRAINED UNPREDICTABLE behavior

If `sz == '1' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

T2

Half-precision scalar variant

Applies when `size == 01`.

```
VMLA{<c>}{<q>}.F16 <Sd>, <Sn>, <Sm>
```

Single-precision scalar variant

Applies when `size == 10`.

```
VMLA{<c>}{<q>}.F32 <Sd>, <Sn>, <Sm>
```

Double-precision scalar variant

Applies when `size == 11`.

```
VMLA{<c>}{<q>}.F64 <Dd>, <Dn>, <Dm>
```

Decode for all variants of this encoding

```
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
if size == '01' && InITBlock()  then UNPREDICTABLE;
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
advsimd = FALSE; add = (op == '0');
case size of
    when '01' esize = 16; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
    when '10' esize = 32; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
    when '11' esize = 64; d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

`<c>` For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding A2, T1 and T2: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<dt>` Is the data type for the elements of the vectors, encoded in the "sz" field. It can have the following values:

`F32` when `sz = 0`

`F16` when `sz = 1`

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Qn>` Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

<Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.

<Sn> Is the 32-bit name of the first SIMD&FP source register, encoded in the "Vn:N" field.

<Sm> Is the 32-bit name of the second SIMD&FP source register, encoded in the "Vm:M" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDOrVFPEnabled(TRUE, advsimd);
    if advsimd then  // Advanced SIMD instruction
        for r = 0 to regs-1
            for e = 0 to elements-1
                product = FPMul(Elem[D[n+r],e,esize], Elem[D[m+r],e,esize], StandardFPSCRValue());
                addend = if add then product else FPNeg(product);

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<type> The data type for the elements of the operands. It must be one of:

- S — Optional in encoding T1/A1. Encoded as U = 0 in encoding T2/A2.
- U — Optional in encoding T1/A1. Encoded as U = 1 in encoding T2/A2.
- I — Available only in encoding T1/A1.

<size> The data size for the elements of the operands. It must be one of:

- 8 — Encoded as size = 0b00.
- 16 — Encoded as size = 0b01.
- 32 — Encoded as size = 0b10.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            product = Int(Elem[Din[n+r],e,esize],unsigned) * Int(Elem[Din[m+r],e,esize],unsigned);
            addend = if add then product else -product;
            if long_destination then
                Elem[Q[d>>1],e,2*esize] = Elem[Qin[d>>1],e,2*esize] + addend;
            else
                Elem[D[d+r],e,esize] = Elem[Din[d+r],e,esize] + addend;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

F6.1.116 VMLA (by scalar)

Vector Multiply Accumulate multiplies elements of a vector by a scalar, and adds the products to corresponding elements of the destination vector.

For more information about scalars see *Advanced SIMD scalars* on page F2-3686.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

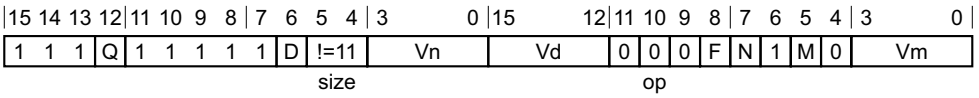
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VMLA{<c>}{<q>}.<dt> <Dd>, <Dn>, <Dm[x]>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VMLA{<c>}{<q>}.<dt> <Qd>, <Qn>, <Dm[x]>
```

Decode for all variants of this encoding

```
if size == '11' then SEE "Related encodings";
if size == '00' || (F == '1' && size == '01' && !HaveFP16Ext()) then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1') then UNDEFINED;
unsigned = FALSE;  // "Don't care" value: TRUE produces same functionality
add = (op == '0');  floating_point = (F == '1');  long_destination = FALSE;
d = UInt(D:Vd);  n = UInt(N:Vn);  regs = if Q == '0' then 1 else 2;
if size == '01' then esize = 16;  elements = 4;  m = UInt(Vm<2:0>);  index = UInt(M:Vm<3>);
if size == '10' then esize = 32;  elements = 2;  m = UInt(Vm);  index = UInt(M);
```

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VMLA{<c>}{<q>}.<dt> <Dd>, <Dn>, <Dm[x]>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VMLA{<c>}{<q>}.<dt> <Qd>, <Qn>, <Dm[x]>
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Decode for all variants of this encoding

```
if size == '11' then SEE "Related encodings";
if size == '00' || (F == '1' && size == '01' && !HaveFP16Ext()) then UNDEFINED;
if F == '1' && size == '01' && InITBlock() then UNPREDICTABLE;
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1') then UNDEFINED;
unsigned = FALSE;  // "Don't care" value: TRUE produces same functionality
add = (op == '0');  floating_point = (F == '1');  long_destination = FALSE;
d = UInt(D:Vd);  n = UInt(N:Vn);  regs = if Q == '0' then 1 else 2;
if size == '01' then esize = 16;  elements = 4;  m = UInt(Vm<2:0>);  index = UInt(M:Vm<3>);
if size == '10' then esize = 32;  elements = 2;  m = UInt(Vm);  index = UInt(M);
```

CONSTRAINED UNPREDICTABLE behavior

If `F == '1' && size == '01' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Notes for all encodings

Related encodings: See *Advanced SIMD data-processing* on page F3-3713 for the T32 instruction set, or *Advanced SIMD data-processing* on page F4-3799 for the A32 instruction set.

Assembler symbols

`<c>` For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<dt>` Is the data type for the scalar and the elements of the operand vector, encoded in the "F:size" field. It can have the following values:

`I16`	when `F = 0, size = 01`
`I32`	when `F = 0, size = 10`
`F16`	when `F = 1, size = 01`
`F32`	when `F = 1, size = 10`

`<Qd>` Is the 128-bit name of the SIMD&FP register holding the accumulate vector, encoded in the "D:Vd" field as <Qd>*2.

`<Qn>` Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP register holding the accumulate vector, encoded in the "D:Vd" field.

`<Dn>` Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

`<Dm[x]>` Is the 64-bit name of the second SIMD&FP source register holding the scalar. If `<dt>` is `I16` or `F16`, `Dm` is restricted to D0-D7. `Dm` is encoded in "Vm<2:0>", and `x` is encoded in "M:Vm<3>". If `<dt>` is `I32` or `F32`, `Dm` is restricted to D0-D15. `Dm` is encoded in "Vm", and `x` is encoded in "M".

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    op2 = Elem[Din[m],index,esize];  op2val = Int(op2, unsigned);
    for r = 0 to regs-1
```

<type> The data type for the elements of the operands. It must be one of:

S Optional in encoding T1/A1. Encoded as U = 0 in encoding T2/A2.

U Optional in encoding T1/A1. Encoded as U = 1 in encoding T2/A2.

I Available only in encoding T1/A1.

<size> The data size for the elements of the operands. It must be one of:

8 Encoded as size = 0b00.

16 Encoded as size = 0b01.

32 Encoded as size = 0b10.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            product = Int(Elem[Din[n+r],e,esize],unsigned) * Int(Elem[Din[m+r],e,esize],unsigned);
            addend = if add then product else -product;
            if long_destination then
                Elem[Q[d>>1],e,2*esize] = Elem[Qin[d>>1],e,2*esize] + addend;
            else
                Elem[D[d+r],e,esize] = Elem[Din[d+r],e,esize] + addend;
```

Operational information

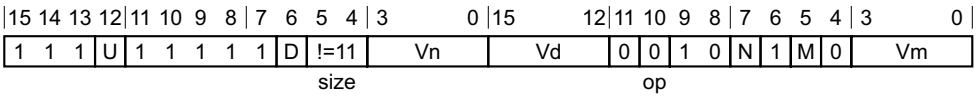
F6.1.118 VMLAL (by scalar)

Vector Multiply Accumulate Long multiplies elements of a vector by a scalar, and adds the products to corresponding elements of the destination vector. The destination vector elements are twice as long as the elements that are multiplied.

For more information about scalars see *Advanced SIMD scalars* on page F2-3686.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1



A1 variant

```
VMLAL{<c>}{<q>}.<dt> <Qd>, <Dn>, <Dm[x]>
```

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
if size == '00' || Vd<0> == '1' then UNDEFINED;
unsigned = (U == '1');  add = (op == '0');  floating_point = FALSE;  long_destination = TRUE;
d = UInt(D:Vd);  n = UInt(N:Vn);  regs = 1;
if size == '01' then esize = 16;  elements = 4;  m = UInt(Vm<2:0>);  index = UInt(M:Vm<3>);
if size == '10' then esize = 32;  elements = 2;  m = UInt(Vm);  index = UInt(M);
```

T1

T1 variant

```
VMLAL{<c>}{<q>}.<dt> <Qd>, <Dn>, <Dm[x]>
```

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
if size == '00' || Vd<0> == '1' then UNDEFINED;
unsigned = (U == '1');  add = (op == '0');  floating_point = FALSE;  long_destination = TRUE;
d = UInt(D:Vd);  n = UInt(N:Vn);  regs = 1;
if size == '01' then esize = 16;  elements = 4;  m = UInt(Vm<2:0>);  index = UInt(M:Vm<3>);
if size == '10' then esize = 32;  elements = 2;  m = UInt(Vm);  index = UInt(M);
```

Notes for all encodings

Related encodings: See *Advanced SIMD data-processing* on page F3-3713 for the T32 instruction set, or *Advanced SIMD data-processing* on page F4-3799 for the A32 instruction set.

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<dt>` Is the data type for the scalar and the elements of the operand vector, encoded in the "U:size" field. It can have the following values:

`S16` when `U = 0`, `size = 01`

`S32` when `U = 0`, `size = 10`

`U16` when `U = 1`, `size = 01`

`U32` when `U = 1`, `size = 10`

`<Qd>` Is the 128-bit name of the SIMD&FP register holding the accumulate vector, encoded in the "D:Vd" field as <Qd>*2.

`<Dn>` Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

`<Dm[x]>` Is the 64-bit name of the second SIMD&FP source register holding the scalar. If `<dt>` is `S16` or `U16`, `Dm` is restricted to D0-D7. `Dm` is encoded in "Vm<2:0>", and `x` is encoded in "M:Vm<3>". If `<dt>` is `S32` or `U32`, `Dm` is restricted to D0-D15. `Dm` is encoded in "Vm", and `x` is encoded in "M".

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    op2 = Elem[Din[m],index,esize];  op2val = Int(op2, unsigned);
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = Elem[Din[n+r],e,esize];  op1val = Int(op1, unsigned);
            if floating_point then
                fp_addend = if add then FPMul(op1,op2,StandardFPSCRValue()) else
FPNeg(FPMul(op1,op2,StandardFPSCRValue()));
                Elem[D[d+r],e,esize] = FPAdd(Elem[Din[d+r],e,esize], fp_addend, StandardFPSCRValue());
            else
                addend = if add then op1val*op2val else -op1val*op2val;
                if long_destination then
                    Elem[Q[d>>1],e,2*esize] = Elem[Qin[d>>1],e,2*esize] + addend;
                else
                    Elem[D[d+r],e,esize] = Elem[Din[d+r],e,esize] + addend;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

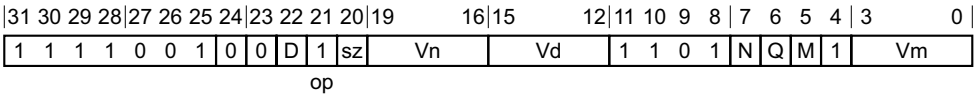
F6.1.119 VMLS (floating-point)



Vector Multiply Subtract multiplies corresponding elements in two vectors, subtracts the products from corresponding elements of the destination vector, and places the results in the destination vector.

Note

Arm recommends that software does not use the `VMLS` instruction in the Round towards Plus Infinity and Round towards Minus Infinity rounding modes, because the rounding of the product and of the sum can change the result of the instruction in opposite directions, defeating the purpose of these rounding modes.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

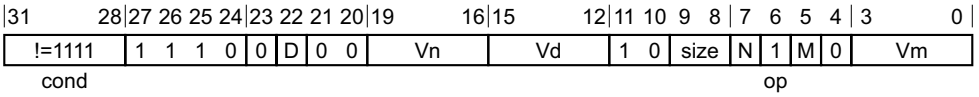
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VMLS{<c>}{<q>}.<dt> <Dd>, <Dn>, <Dm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VMLS{<c>}{<q>}.<dt> <Qd>, <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
advsimd = TRUE;  add = (op == '0');
case sz of
    when '0' esize = 32; elements = 2;
    when '1' esize = 16; elements = 4;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

A2

Half-precision scalar variant

Applies when `size == 01`.

```
VMLS{<c>}{<q>}.F16 <Sd>, <Sn>, <Sm>
```

Single-precision scalar variant

Applies when `size == 10`.

```
VMLS{<c>}{<q>}.F32 <Sd>, <Sn>, <Sm>
```

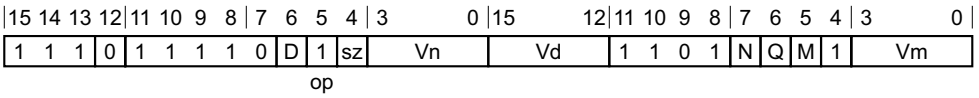
Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Double-precision scalar variant

Applies when `size == 11`.

```
VMLS{<c>}{<q>}.F64 <Dd>, <Dn>, <Dm>
```

Decode for all variants of this encoding



```
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
if size == '01' && cond != '1110' then UNPREDICTABLE;
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
advsimd = FALSE; add = (op == '0');
case size of
    when '01' esize = 16; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
    when '10' esize = 32; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
    when '11' esize = 64; d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && cond != '1110'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VMLS{<c>}{<q>}.<dt> <Dd>, <Dn>, <Dm>
```

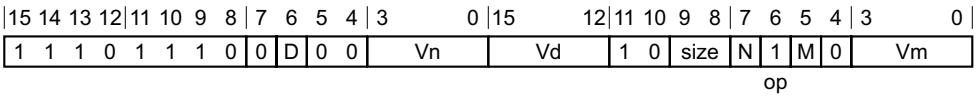
128-bit SIMD vector variant

Applies when `Q == 1`.

```
VMLS{<c>}{<q>}.<dt> <Qd>, <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
if sz == '1' && InITBlock() then UNPREDICTABLE;
advsimd = TRUE;  add = (op == '0');
case sz of
    when '0' esize = 32; elements = 2;
    when '1' esize = 16; elements = 4;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```



CONSTRAINED UNPREDICTABLE behavior

If `sz == '1' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Non-Confidential

T2

Half-precision scalar variant

Applies when `size == 01`.

```
VMLS{<c>}{<q>}.F16 <Sd>, <Sn>, <Sm>
```

Single-precision scalar variant

Applies when `size == 10`.

```
VMLS{<c>}{<q>}.F32 <Sd>, <Sn>, <Sm>
```

Double-precision scalar variant

Applies when `size == 11`.

```
VMLS{<c>}{<q>}.F64 <Dd>, <Dn>, <Dm>
```

Decode for all variants of this encoding

```
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
if size == '01' && InITBlock()  then UNPREDICTABLE;
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
advsimd = FALSE; add = (op == '0');
case size of
    when '01' esize = 16; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
    when '10' esize = 32; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
    when '11' esize = 64; d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

`<c>` For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding A2, T1 and T2: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<dt>` Is the data type for the elements of the vectors, encoded in the "sz" field. It can have the following values:

`F32` when `sz = 0`

`F16` when `sz = 1`

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Qn>` Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

d = UInt(D:Vd);  n = UInt(N:Vn);  regs = if Q == '0' then 1 else 2;
if size == '01' then esize = 16;  elements = 4;  m = UInt(Vm<2:0>);  index = UInt(M:Vm<3>);
if size == '10' then esize = 32;  elements = 2;  m = UInt(Vm);  index = UInt(M);
```

CONSTRAINED UNPREDICTABLE behavior

If `F == '1' && size == '01' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Notes for all encodings

Related encodings: See *Advanced SIMD data-processing* on page F3-3713 for the T32 instruction set, or *Advanced SIMD data-processing* on page F4-3799 for the A32 instruction set.

Assembler symbols

`<c>` For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<dt>` Is the data type for the scalar and the elements of the operand vector, encoded in the "F:size" field. It can have the following values:

`I16`	when `F = 0, size = 01`
`I32`	when `F = 0, size = 10`
`F16`	when `F = 1, size = 01`
`F32`	when `F = 1, size = 10`

`<Qd>` Is the 128-bit name of the SIMD&FP register holding the accumulate vector, encoded in the "D:Vd" field as <Qd>*2.

`<Qn>` Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP register holding the accumulate vector, encoded in the "D:Vd" field.

`<Dn>` Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

`<Dm[x]>` Is the 64-bit name of the second SIMD&FP source register holding the scalar. If `<dt>` is `I16` or `F16`, `Dm` is restricted to D0-D7. `Dm` is encoded in "Vm<2:0>", and `x` is encoded in "M:Vm<3>". If `<dt>` is `I32` or `F32`, `Dm` is restricted to D0-D15. `Dm` is encoded in "Vm", and `x` is encoded in "M".

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    op2 = Elem[Din[m],index,esize];  op2val = Int(op2, unsigned);
    for r = 0 to regs-1
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

```
        for e = 0 to elements-1
            op1 = Elem[Din[n+r],e,esize];  op1val = Int(op1, unsigned);
            if floating_point then
                fp_addend = if add then FPMul(op1,op2,StandardFPSCRValue()) else
FPNeg(FPMul(op1,op2,StandardFPSCRValue()));
                Elem[D[d+r],e,esize] = FPAdd(Elem[Din[d+r],e,esize], fp_addend, StandardFPSCRValue());
            else
                addend = if add then op1val*op2val else -op1val*op2val;
                if long_destination then
                    Elem[Q[d>>1],e,2*esize] = Elem[Qin[d>>1],e,2*esize] + addend;
                else
                    Elem[D[d+r],e,esize] = Elem[Din[d+r],e,esize] + addend;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

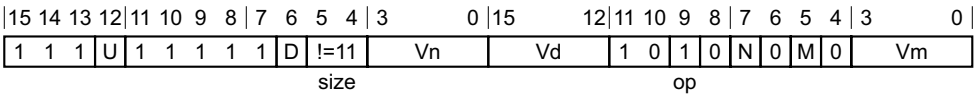
F6.1.122 VMLSL (integer)

Vector Multiply Subtract Long multiplies corresponding elements in two vectors, and subtract the products from the corresponding elements of the destination vector. The destination vector element is twice as long as the elements that are multiplied.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1



A1 variant

```
VMLSL{<c>}{<q>}.<type><size> <Qd>, <Dn>, <Dm> // Encoding T2/A2
```

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
if Vd<0> == '1' then UNDEFINED;
add = (op == '0');  long_destination = TRUE;  unsigned = (U == '1');
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = 1;
```

T1

T1 variant

```
VMLSL{<c>}{<q>}.<type><size> <Qd>, <Dn>, <Dm> // Encoding T2/A2
```

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
if Vd<0> == '1' then UNDEFINED;
add = (op == '0');  long_destination = TRUE;  unsigned = (U == '1');
esize = 8 << UInt(size);  elements = 64 DIV esize;

F6.1.124 VMOV (between two general-purpose registers and a doubleword floating-point register)

Copy two general-purpose registers to or from a SIMD&FP register copies two words from two general-purpose registers into a doubleword register in the Advanced SIMD and floating-point register file, or from a doubleword register in the Advanced SIMD and floating-point register file to two general-purpose registers.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1

From general-purpose registers variant

Applies when `op == 0`.

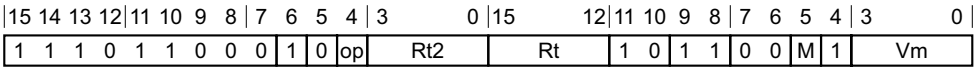
```
VMOV{<c>}{<q>} <Dm>, <Rt>, <Rt2>
```

To general-purpose registers variant

Applies when `op == 1`.

```
VMOV{<c>}{<q>} <Rt>, <Rt2>, <Dm>
```

Decode for all variants of this encoding



```
to_arm_registers = (op == '1');  t = UInt(Rt);  t2 = UInt(Rt2);  m = UInt(M:Vm);
if t == 15 || t2 == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
if to_arm_registers && t == t2 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `to_arm_registers && t == t2`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The value in the destination register is UNKNOWN.

T1

From general-purpose registers variant

Applies when `op == 0`.

```
VMOV{<c>}{<q>} <Dm>, <Rt>, <Rt2>
```

To general-purpose registers variant

Applies when `op == 1`.

```
VMOV{<c>}{<q>} <Rt>, <Rt2>, <Dm>
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Decode for all variants of this encoding

```
to_arm_registers = (op == '1');  t = UInt(Rt);  t2 = UInt(Rt2);  m = UInt(M:Vm);
if t == 15 || t2 == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
if to_arm_registers && t == t2 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `to_arm_registers && t == t2`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The value in the destination register is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VMOV (between two general-purpose registers and a doubleword floating-point register)* on page K1-7207.

Assembler symbols

`<Dm>`	Is the 64-bit name of the SIMD&FP register to be transferred, encoded in the "M:Vm" field.
`<Rt2>`	Is the second general-purpose register that `<Dm>`[63:32] will be transferred to or from, encoded in the "Rt2" field.
`<Rt>`	Is the first general-purpose register that `<Dm>`[31:0] will be transferred to or from, encoded in the "Rt" field.
`<c>`	See *Standard assembler syntax fields* on page F2-3660.
`<q>`	See *Standard assembler syntax fields* on page F2-3660.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckVFPEnabled(TRUE);
    if to_arm_registers then
        R[t] = D[m]<31:0>;
        R[t2] = D[m]<63:32>;
    else
        D[m]<31:0> = R[t];
        D[m]<63:32> = R[t2];
```

F6.1.125 VMOV (between general-purpose register and half-precision)

Copy 16 bits of a general-purpose register to or from a 32-bit SIMD&FP register. This instruction transfers the value held in the bottom 16 bits of a 32-bit SIMD&FP register to the bottom 16 bits of a general-purpose register, or the value held in the bottom 16 bits of a general-purpose register to the bottom 16 bits of a 32-bit SIMD&FP register.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1

ARMv8.2

From general-purpose register variant

Applies when `op == 0`.

```
VMOV{<c>}{<q>}.F16 <Sn>, <Rt>
```

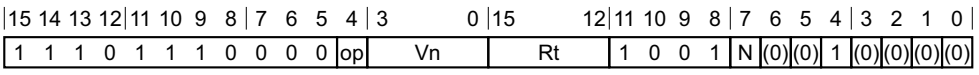
To general-purpose register variant

Applies when `op == 1`.

```
VMOV{<c>}{<q>}.F16 <Rt>, <Sn>
```

Decode for all variants of this encoding

```
if !HaveFP16Ext() then UNDEFINED;
if cond != '1110' then UNPREDICTABLE;
to_arm_register = (op == '1');  t = UInt(Rt);  n = UInt(Vn:N);
if t == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```



CONSTRAINED UNPREDICTABLE behavior

If `cond != '1110'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

T1

ARMv8.2

From general-purpose register variant

bits(16) imm16;
bits(32) imm32;
bits(64) imm64;
case size of
    when '01' d = UInt(Vd:D);  imm16 = VFPExpandImm(imm4H:imm4L); imm32 = Zeros(16) : imm16;
    when '10' d = UInt(Vd:D);  imm32 = VFPExpandImm(imm4H:imm4L);
    when '11' d = UInt(D:Vd);  imm64 = VFPExpandImm(imm4H:imm4L);  regs = 1;
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Notes for all encodings

Related encodings: See *Advanced SIMD one register and modified immediate* on page F3-3722 for the T32 instruction set, or *Advanced SIMD one register and modified immediate* on page F4-3807 for the A32 instruction set.

Assembler symbols

<c> For encoding A1, A3, A4 and A5: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding A2, T1, T2, T3, T4 and T5: see *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<dt> The data type, encoded in the "cmode" field. It can have the following values:

- I32 when cmode = 110x
- I8 when cmode = 1110
- F32 when cmode = 1111

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.

<imm> For encoding A1, A3, A4, A5, T1, T3, T4 and T5: is a constant of the specified type that is replicated to fill the destination register. For details of the range of constants available and the encoding of <imm>, see *Modified immediate constants in T32 and A32 Advanced SIMD instructions* on page F2-3677.

For encoding A2 and T2: is a signed floating-point constant with 3-bit exponent and normalized 4 bits of precision, encoded in "imm4H:imm4L". For details of the range of constants available and the encoding of <imm>, see *Modified immediate constants in T32 and A32 floating-point instructions* on page F2-3678.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDOrVFPEnabled(TRUE, advsimd);
    if single_register then
        S[d] = imm32;
    else
        for r = 0 to regs-1
            D[d+r] = imm64;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

F6.1.127 VMOV (register)

Copy between FP registers copies the contents of one FP register to another.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

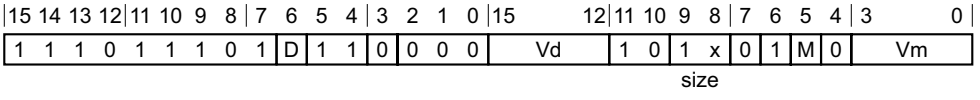
A2

Single-precision scalar variant

Applies when size == 10.

```
VMOV{<c>}{<q>}.F32 <Sd>, <Sm>
```

Double-precision scalar variant



Applies when size == 11.

```
VMOV{<c>}{<q>}.F64 <Dd>, <Dm>
```

Decode for all variants of this encoding

```
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
single_register = (size == '10');  advsimd = FALSE;
if single_register then
    d = UInt(Vd:D);  m = UInt(Vm:M);
else
    d = UInt(D:Vd);  m = UInt(M:Vm);  regs = 1;
```

T2

Single-precision scalar variant

Applies when size == 10.

```
VMOV{<c>}{<q>}.F32 <Sd>, <Sm>
```

Double-precision scalar variant

Applies when size == 11.

```
VMOV{<c>}{<q>}.F64 <Dd>, <Dm>
```

Decode for all variants of this encoding

```
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
single_register = (size == '10');  advsimd = FALSE;
if single_register then
    d = UInt(Vd:D);  m = UInt(Vm:M);
else
    d = UInt(D:Vd);  m = UInt(M:Vm);  regs = 1;
```

Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.

<Sm> Is the 32-bit name of the SIMD&FP source register, encoded in the "Vm:M" field.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDOrVFPEnabled(TRUE, advsimd);
    if single_register then
        S[d] = S[m];
    else
        for r = 0 to regs-1
            D[d+r] = D[m+r];
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

F6.1.128 VMOV (register, SIMD)

Copy between SIMD registers copies the contents of one SIMD register to another

This instruction is an alias of the VORR (register) instruction. This means that:

- The encodings in this description are named to match the encodings of VORR (register).
- The description of VORR (register) gives the operational pseudocode for this instruction.

A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VMOV{<c>}{<q>}{.<dt>} <Dd>, <Dm>
```

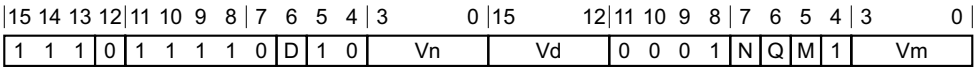
is equivalent to

```
VORR{<c>}{<q>}{.<dt>} <Dd>, <Dm>, <Dm>
```

and is the preferred disassembly when `N:Vn == M:Vm`.

128-bit SIMD vector variant

Applies when `Q == 1`.



```
VMOV{<c>}{<q>}{.<dt>} <Qd>, <Qm>
```

is equivalent to

```
VORR{<c>}{<q>}{.<dt>} <Qd>, <Qm>, <Qm>
```

and is the preferred disassembly when `N:Vn == M:Vm`.

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VMOV{<c>}{<q>}{.<dt>} <Dd>, <Dm>
```

is equivalent to

```
VORR{<c>}{<q>}{.<dt>} <Dd>, <Dm>, <Dm>
```

and is the preferred disassembly when `N:Vn == M:Vm`.

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VMOV{<c>}{<q>}{.<dt>} <Qd>, <Qm>
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

is equivalent to

`VORR{<c>}{<q>}{.<dt>} <Qd>, <Qm>, <Qm>`

and is the preferred disassembly when `N:Vn == M:Vm`.

Assembler symbols

`<c>` For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<dt>` An optional data type. `<dt>` must not be `F64`, but it is otherwise ignored.

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Qm>` Is the 128-bit name of the SIMD&FP source register, encoded in the "N:Vn" and "M:Vm" field as <Qm>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

`<Dm>` Is the 64-bit name of the SIMD&FP source register, encoded in the "N:Vn" and "M:Vm" field.

Operation for all encodings

The description of VORR (register) gives the operational pseudocode for this instruction.

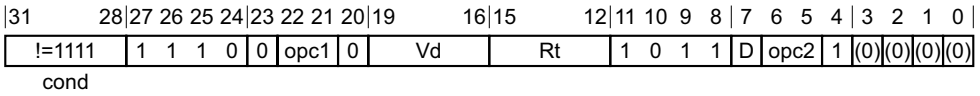
F6.1.129 VMOV (general-purpose register to scalar)



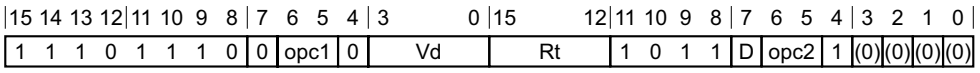
Copy a general-purpose register to a vector element copies a byte, halfword, or word from a general-purpose register into an Advanced SIMD scalar.

On a Floating-point-only system, this instruction transfers one word to the upper or lower half of a double-precision floating-point register from a general-purpose register. This is an identical operation to the Advanced SIMD single word transfer.

For more information about scalars see *Advanced SIMD scalars* on page F2-3686.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1



A1 variant

```
VMOV{<c>}{<q>}{.<size>} <Dd[x]>, <Rt>
```

Decode for this encoding

```
case opc1:opc2 of
    when '1xxx'  advsimd = TRUE;  esize = 8;  index = UInt(opc1<0>:opc2);
    when '0xx1'  advsimd = TRUE;  esize = 16;  index = UInt(opc1<0>:opc2<1>);
    when '0x00'  advsimd = FALSE;  esize = 32;  index = UInt(opc1<0>);
    when '0x10'  UNDEFINED;
d = UInt(D:Vd);  t = UInt(Rt);
if t == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

T1

T1 variant

```
VMOV{<c>}{<q>}{.<size>} <Dd[x]>, <Rt>
```

Decode for this encoding

```
case opc1:opc2 of
    when '1xxx'  advsimd = TRUE;  esize = 8;  index = UInt(opc1<0>:opc2);
    when '0xx1'  advsimd = TRUE;  esize = 16;  index = UInt(opc1<0>:opc2<1>);
    when '0x00'  advsimd = FALSE;  esize = 32;  index = UInt(opc1<0>);
    when '0x10'  UNDEFINED;
d = UInt(D:Vd);  t = UInt(Rt);
if t == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<size>` The data size. It must be one of:

- `8` Encoded as `opc1<1>` = 1. `[x]` is encoded in `opc1<0>`, `opc2`.
- `16` Encoded as `opc1<1>` = 0, `opc2<0>` = 1. `[x]` is encoded in `opc1<0>`, `opc2<1>`.
- `32` Encoded as `opc1<1>` = 0, `opc2` = `0b00`. `[x]` is encoded in `opc1<0>`.
- `omitted` Equivalent to `32`.

`<Dd[x]>` The scalar. The register `<Dd>` is encoded in D:Vd. For details of how `[x]` is encoded, see the description of `<size>`.

`<Rt>` The source general-purpose register.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDOrVFPEnabled(TRUE, advsimd);
    Elem[D[d],index,esize] = R[t]<esize-1:0>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

Non-Confidential

F6.1.130 VMOV (between general-purpose register and single-precision)

Copy a general-purpose register to or from a 32-bit SIMD&FP register. This instruction transfers the value held in a 32-bit SIMD&FP register to a general-purpose register, or the value held in a general-purpose register to a 32-bit SIMD&FP register.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

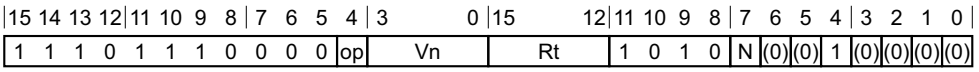
A1

From general-purpose register variant

Applies when `op == 0`.

```
VMOV{<c>}{<q>} <Sn>, <Rt>
```

To general-purpose register variant



Applies when `op == 1`.

```
VMOV{<c>}{<q>} <Rt>, <Sn>
```

Decode for all variants of this encoding

```
to_arm_register = (op == '1');  t = UInt(Rt);  n = UInt(Vn:N);
if t == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

T1

From general-purpose register variant

Applies when `op == 0`.

```
VMOV{<c>}{<q>} <Sn>, <Rt>
```

To general-purpose register variant

Applies when `op == 1`.

```
VMOV{<c>}{<q>} <Rt>, <Sn>
```

Decode for all variants of this encoding

```
to_arm_register = (op == '1');  t = UInt(Rt);  n = UInt(Vn:N);
if t == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Assembler symbols

<Rt> Is the general-purpose register that <Sn> will be transferred to or from, encoded in the "Rt" field.

<Sn> Is the 32-bit name of the SIMD&FP register to be transferred, encoded in the "Vn:N" field.

<c> See *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckVFPEnabled(TRUE);
    if to_arm_register then
        R[t] = S[n];
    else
        S[n] = R[t];
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

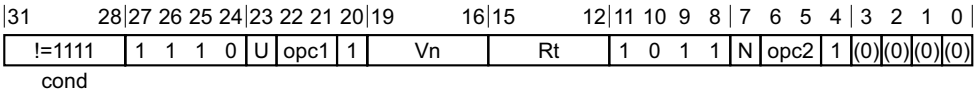
F6.1.131 VMOV (scalar to general-purpose register)



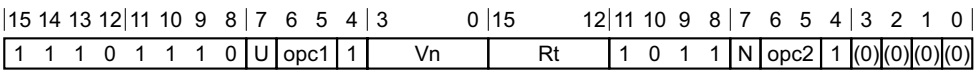
Copy a vector element to a general-purpose register with sign or zero extension copies a byte, halfword, or word from an Advanced SIMD scalar to a general-purpose register. Bytes and halfwords can be either zero-extended or sign-extended.

On a Floating-point-only system, this instruction transfers one word from the upper or lower half of a double-precision floating-point register to a general-purpose register. This is an identical operation to the Advanced SIMD single word transfer.

For more information about scalars see *Advanced SIMD scalars* on page F2-3686.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1



A1 variant

```
VMOV{<c>}{<q>}{.<dt>} <Rt>, <Dn[x]>
```

Decode for this encoding

```
case U:opc1:opc2 of
    when 'x1xxx'  advsimd = TRUE;  esize = 8;  index = UInt(opc1<0>:opc2);
    when 'x0xx1'  advsimd = TRUE;  esize = 16;  index = UInt(opc1<0>:opc2<1>);
    when '00x00'  advsimd = FALSE;  esize = 32;  index = UInt(opc1<0>);
    when '10x00'  UNDEFINED;
    when 'x0x10'  UNDEFINED;
t = UInt(Rt);  n = UInt(N:Vn);  unsigned = (U == '1');
if t == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

T1

T1 variant

```
VMOV{<c>}{<q>}{.<dt>} <Rt>, <Dn[x]>
```

Decode for this encoding

```
case U:opc1:opc2 of
    when 'x1xxx'  advsimd = TRUE;  esize = 8;  index = UInt(opc1<0>:opc2);
    when 'x0xx1'  advsimd = TRUE;  esize = 16;  index = UInt(opc1<0>:opc2<1>);
    when '00x00'  advsimd = FALSE;  esize = 32;  index = UInt(opc1<0>);
    when '10x00'  UNDEFINED;
    when 'x0x10'  UNDEFINED;
t = UInt(Rt);  n = UInt(N:Vn);  unsigned = (U == '1');
if t == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<dt>` The data type. It must be one of:

`S8`	Encoded as U = 0, `opc1<1>` = 1. `[x]` is encoded in `opc1<0>`, `opc2`.
`S16`	Encoded as U = 0, `opc1<1>` = 0, `opc2<0>` = 1. `[x]` is encoded in `opc1<0>`, `opc2<1>`.
`U8`	Encoded as U = 1, `opc1<1>` = 1. `[x]` is encoded in `opc1<0>`, `opc2`.
`U16`	Encoded as U = 1, `opc1<1>` = 0, `opc2<0>` = 1. `[x]` is encoded in `opc1<0>`, `opc2<1>`.
`32`	Encoded as U = 0, `opc1<1>` = 0, `opc2` = `0b00`. `[x]` is encoded in `opc1<0>`.
`omitted`	Equivalent to `32`.

`<Rt>` The destination general-purpose register.

`<Dn[x]>` The scalar. For details of how `[x]` is encoded see the description of `<dt>`.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDOrVFPEnabled(TRUE, advsimd);
    if unsigned then
        R[t] = ZeroExtend(Elem[D[n],index,esize], 32);
    else
        R[t] = SignExtend(Elem[D[n],index,esize], 32);
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

F6.1.132 VMOV (between two general-purpose registers and two single-precision registers)

Copy two general-purpose registers to a pair of 32-bit SIMD&FP registers transfers the contents of two consecutively numbered single-precision Floating-point registers to two general-purpose registers, or the contents of two general-purpose registers to a pair of single-precision Floating-point registers. The general-purpose registers do not have to be contiguous.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1

From general-purpose registers variant

Applies when `op == 0`.

```
VMOV{<c>}{<q>} <Sm>, <Sm1>, <Rt>, <Rt2>
```

To general-purpose registers variant

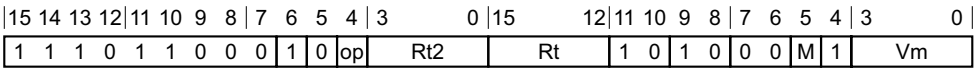
Applies when `op == 1`.

```
VMOV{<c>}{<q>} <Rt>, <Rt2>, <Sm>, <Sm1>
```

Decode for all variants of this encoding

```
to_arm_registers = (op == '1');  t = UInt(Rt);  t2 = UInt(Rt2);  m = UInt(Vm:M);
if t == 15 || t2 == 15 || m == 31 then UNPREDICTABLE;
if to_arm_registers && t == t2 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior



If `to_arm_registers && t == t2`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The value in the destination register is UNKNOWN.

If `m == 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- One or more of the single-precision registers become UNKNOWN for a move to the single-precision register. The general-purpose registers listed in the instruction become UNKNOWN for a move from the single-precision registers. This behavior does not affect any other general-purpose registers.

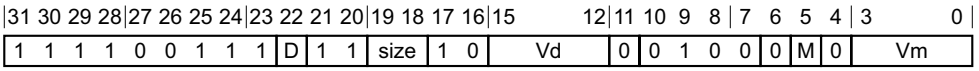
F6.1.134 VMOVN



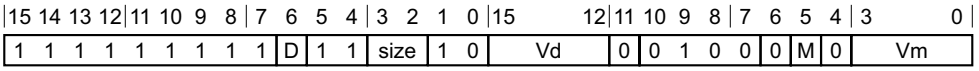
Vector Move and Narrow copies the least significant half of each element of a quadword vector into the corresponding elements of a doubleword vector.

The operand vector elements can be any one of 16-bit, 32-bit, or 64-bit integers. There is no distinction between signed and unsigned integers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

This instruction is used by the pseudo-instructions VRSHRN (zero) and VSHRN (zero). The pseudo-instruction is never the preferred disassembly.

A1



A1 variant

```
VMOVN{<c>}{<q>}.<dt> <Dd>, <Qm>
```

Decode for this encoding

```
if size == '11' then UNDEFINED;
if Vm<0> == '1' then UNDEFINED;
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  m = UInt(M:Vm);
```

T1

T1 variant

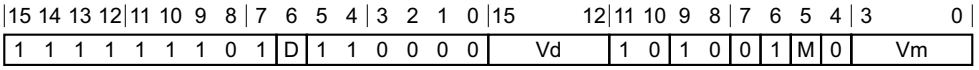
ARMv8.2

A1 variant



```
VMOVX{<q>}.F16 <Sd>, <Sm>
```

Decode for this encoding

```
if !HaveFP16Ext() then UNDEFINED;
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
d = UInt(Vd:D); m = UInt(Vm:M);
```

T1

ARMv8.2

T1 variant

```
VMOVX{<q>}.F16 <Sd>, <Sm>
```

Decode for this encoding

```
if InITBlock() then UNPREDICTABLE;
if !HaveFP16Ext() then UNDEFINED;
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
d = UInt(Vd:D); m = UInt(Vm:M);
```

CONSTRAINED UNPREDICTABLE behavior

If `InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

<q>	See *Standard assembler syntax fields* on page F2-3660.
<Sd>	Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.

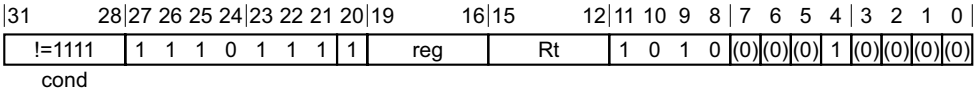
F6.1.136 VMRS

Move SIMD&FP Special register to general-purpose register moves the value of an Advanced SIMD and floating-point System register to a general-purpose register. When the specified System register is the FPSCR, a form of the instruction transfers the FPSCR.{N, Z, C, V} condition flags to the APSR.{N, Z, C, V} condition flags.



Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

When these settings permit the execution of floating-point and Advanced SIMD instructions, if the specified floating-point System register is not the FPSCR, the instruction is UNDEFINED if executed in User mode.

In an implementation that includes EL2, when HCR.TID0 is set to 1, any VMRS access to FPSID from a Non-secure EL1 mode that would be permitted if HCR.TID0 was set to 0 generates a Hyp Trap exception. For more information, see *ID group 0, Primary device identification registers* on page G1-5339.

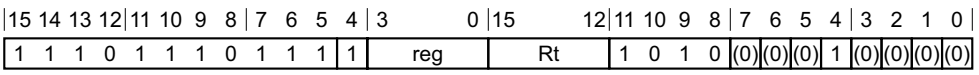
For simplicity, the VMRS pseudocode does not show the possible trap to Hyp mode.

A1

A1 variant

```
VMRS{<c>}{<q>} <Rt>, <spec_reg>
```

Decode for this encoding



```
t = UInt(Rt);
if !(reg IN {'000x', '0101', '011x', '1000'}) then UNPREDICTABLE;
if t == 15 && reg != '0001' then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If `!(reg IN {'000x', '0101', '011x', '1000'})`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction transfers an UNKNOWN value to the specified target register. When the Rt field holds the value `0b1111`, the specified target register is the APSR.{N, Z, C, V} bits, and these bits become UNKNOWN. Otherwise, the specified target register is the register specified by the `Rt` field, R0 - R14.

T1

T1 variant

```
VMRS{<c>}{<q>} <Rt>, <spec_reg>
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Decode for this encoding

```
t = UInt(Rt);
if !(reg IN {'000x', '0101', '011x', '1000'}) then UNPREDICTABLE;
if t == 15 && reg != '0001' then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If `!(reg IN {'000x', '0101', '011x', '1000'})`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction transfers an UNKNOWN value to the specified target register. When the Rt field holds the value `0b1111`, the specified target register is the APSR.{N, Z, C, V} bits, and these bits become UNKNOWN. Otherwise, the specified target register is the register specified by the `Rt` field, R0 - R14.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<Rt>` Is the general-purpose destination register, encoded in the "Rt" field. Is one of:

`R0-R14`	General-purpose register.
`APSR_nzcv`	Permitted only when `<spec_reg>` is `FPSCR`. Encoded as `0b1111`. The instruction transfers the FPSCR.{N, Z, C, V} condition flags to the APSR.{N, Z, C, V} condition flags.

`<spec_reg>` Is the source Advanced SIMD and floating-point System register, encoded in the "reg" field. It can have the following values:

`FPSID`	when `reg = 0000`
`FPSCR`	when `reg = 0001`
`MVFR2`	when `reg = 0101`
`MVFR1`	when `reg = 0110`
`MVFR0`	when `reg = 0111`
`FPEXC`	when `reg = 1000`

The following encodings are UNPREDICTABLE:

- `reg = 001x`.
- `reg = 0100`.
- `reg = 1001`.
- `reg = 101x`.
- `reg = 11xx`.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if reg == '0001' then                 // FPSCR
        CheckVFPEnabled(TRUE);
        if t == 15 then
            PSTATE.<N,Z,C,V> = FPSR.<N,Z,C,V>;
```

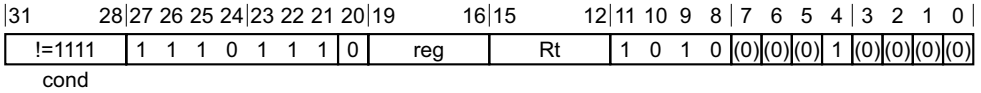
F6.1.137 VMSR



Move general-purpose register to SIMD&FP Special register moves the value of a general-purpose register to a floating-point System register.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

When these settings permit the execution of floating-point and Advanced SIMD instructions:

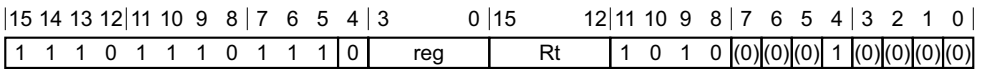
- If the specified floating-point System register is FPSID or FPEXC, the instruction is UNDEFINED if executed in User mode.
- If the specified floating-point System register is the FPSID and the instruction is executed in a mode other than User mode, the instruction is ignored.

A1

A1 variant

```
VMSR{<c>}{<q>} <spec_reg>, <Rt>
```

Decode for this encoding



```
t = UInt(Rt);
if reg != '000x' && reg != '1000' then UNPREDICTABLE;
if t == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If `reg != '000x' && reg != '1000'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction transfers the value in the general-purpose register to one of the allocated registers accessible using `VMSR` at the same Exception level.

T1

T1 variant

```
VMSR{<c>}{<q>} <spec_reg>, <Rt>
```

Decode for this encoding

```
t = UInt(Rt);
if reg != '000x' && reg != '1000' then UNPREDICTABLE;
if t == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

CONSTRAINED UNPREDICTABLE behavior

If `reg != '000x' && reg != '1000'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction transfers the value in the general-purpose register to one of the allocated registers accessible using `VMSR` at the same Exception level.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<spec_reg>` Is the destination Advanced SIMD and floating-point System register, encoded in the "reg" field. It can have the following values:

`FPSID`	when `reg = 0000`
`FPSCR`	when `reg = 0001`
`FPEXC`	when `reg = 1000`

The following encodings are UNPREDICTABLE:

- `reg = 001x`.
- `reg = 01xx`.
- `reg = 1001`.
- `reg = 101x`.
- `reg = 11xx`.

`<Rt>` Is the general-purpose source register, encoded in the "Rt" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if reg == '0001' then                 // FPSCR
        CheckVFPEnabled(TRUE);
        FPSCR = R[t];
    elsif PSTATE.EL == EL0 then
        UNDEFINED;                        // Non-FPSCR registers accessible only at PL1 or above
    else
        CheckVFPEnabled(FALSE);           // Non-FPSCR registers are not affected by FPEXC.EN
        case reg of
            when '0000'                   // VMSR access to FPSID is ignored
            when '1000'  FPEXC = R[t];
            otherwise    Unreachable();   // Dealt with above or in encoding-specific pseudocode
```

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

`<c>` For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding A2, T1 and T2: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<dt>` Is the data type for the elements of the vectors, encoded in the "sz" field. It can have the following values:

`F32` when `sz = 0`

`F16` when `sz = 1`

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Qn>` Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

<Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.

<Sn> Is the 32-bit name of the first SIMD&FP source register, encoded in the "Vn:N" field.

<Sm> Is the 32-bit name of the second SIMD&FP source register, encoded in the "Vm:M" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDOrVFPEnabled(TRUE, advsimd);
    if advsimd then  // Advanced SIMD instruction
        for r = 0 to regs-1
            for e = 0 to elements-1
                Elem[D[d+r],e,esize] = FPMul(Elem[D[n+r],e,esize], Elem[D[m+r],e,esize],
StandardFPSCRValue());
    else             // VFP instruction
        case esize of
            when 16
                S[d] = Zeros(16) : FPMul(S[n]<15:0>, S[m]<15:0>, FPSCR);
            when 32
                S[d] = FPMul(S[n], S[m], FPSCR);
            when 64
                D[d] = FPMul(D[n], D[m], FPSCR);
```

F6.1.139 VMUL (integer and polynomial)

Vector Multiply multiplies corresponding elements in two vectors.

For information about multiplying polynomials see *Polynomial arithmetic over {0, 1}* on page A1-48.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

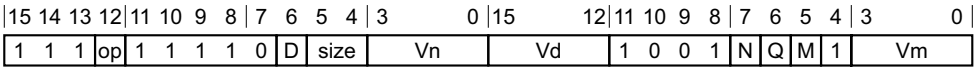
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VMUL{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VMUL{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>
```

Decode for all variants of this encoding

```
if size == '11' || (op == '1' && size != '00') then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
unsigned = FALSE;  // "Don't care" value: TRUE produces same functionality
polynomial = (op == '1');  long_destination = FALSE;
esize = 8 << UInt(size);  elements = 64 DIV esize;

```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<dt> Is the data type for the elements of the operands, encoded in the "op:size" field. It can have the following values:

- I8 when op = 0, size = 00
- I16 when op = 0, size = 01
- I32 when op = 0, size = 10
- P8 when op = 1, size = 00

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = Elem[Din[n+r],e,esize];  op1val = Int(op1, unsigned);
            op2 = Elem[Din[m+r],e,esize];  op2val = Int(op2, unsigned);
            if polynomial then
                product = PolynomialMult(op1,op2);
            else
                product = (op1val*op2val)<2*esize-1:0>;
            if long_destination then
                Elem[Q[d>>1],e,2*esize] = product;
            else
                Elem[D[d+r],e,esize] = product<esize-1:0>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

if size == '10' then esize = 32;  elements = 2;  m = UInt(Vm);  index = UInt(M);
```

CONSTRAINED UNPREDICTABLE behavior

If `F == '1' && size == '01' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Notes for all encodings

Related encodings: See *Advanced SIMD data-processing* on page F3-3713 for the T32 instruction set, or *Advanced SIMD data-processing* on page F4-3799 for the A32 instruction set.

Assembler symbols

`<c>` For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<dt>` Is the data type for the scalar and the elements of the operand vector, encoded in the "F:size" field. It can have the following values:

`I16`	when `F = 0, size = 01`
`I32`	when `F = 0, size = 10`
`F16`	when `F = 1, size = 01`
`F32`	when `F = 1, size = 10`

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Qn>` Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

`<Dn>` Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

`<Dm>` Is the 64-bit name of the second SIMD&FP source register. When `<dt>` is I16 or F16, this is encoded in the "Vm<2:0>" field. Otherwise it is encoded in the "Vm" field.

`<index>` Is the element index. When `<dt>` is I16 or F16, this is in the range 0 to 3 and is encoded in the "M:Vm<3>" field. Otherwise it is in the range 0 to 1 and is encoded in the "M" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    op2 = Elem[Din[m],index,esize];  op2val = Int(op2, unsigned);
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = Elem[Din[n+r],e,esize];  op1val = Int(op1, unsigned);
            if floating_point then
                Elem[D[d+r],e,esize] = FPMul(op1, op2, StandardFPSCRValue());
            else
```

A1 variant

```
VMULL{<c>}{<q>}.<dt> <Qd>, <Dn>, <Dm>[<index>]
```

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
if size == '00' || Vd<0> == '1' then UNDEFINED;
unsigned = (U == '1');  long_destination = TRUE;  floating_point = FALSE;
d = UInt(D:Vd);  n = UInt(N:Vn);  regs = 1;
if size == '01' then esize = 16;  elements = 4;  m = UInt(Vm<2:0>);  index = UInt(M:Vm<3>);
if size == '10' then esize = 32;  elements = 2;  m = UInt(Vm);  index = UInt(M);
```

T1

T1 variant

```
VMULL{<c>}{<q>}.<dt> <Qd>, <Dn>, <Dm>[<index>]
```

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
if size == '00' || Vd<0> == '1' then UNDEFINED;
unsigned = (U == '1');  long_destination = TRUE;  floating_point = FALSE;
d = UInt(D:Vd);  n = UInt(N:Vn);  regs = 1;
if size == '01' then esize = 16;  elements = 4;  m = UInt(Vm<2:0>);  index = UInt(M:Vm<3>);
if size == '10' then esize = 32;  elements = 2;  m = UInt(Vm);  index = UInt(M);
```

Notes for all encodings

Related encodings: See *Advanced SIMD data-processing* on page F3-3713 for the T32 instruction set, or *Advanced SIMD data-processing* on page F4-3799 for the A32 instruction set.

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

<q> See *Standard assembler syntax fields* on page F2-3660.

<dt> Is the data type for the scalar and the elements of the operand vector, encoded in the "U:size" field. It can have the following values:

S16 when U = 0, size = 01

S32 when U = 0, size = 10

U16 when U = 1, size = 01

U32 when U = 1, size = 10

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "Vm<2:0>" field when <dt> is S16 or U16, otherwise the "Vm" field.

<index> Is the element index in the range 0 to 3, encoded in the "M:Vm<3>" field when <dt> is S16 or U16, otherwise in range 0 to 1, encoded in the "M" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    op2 = Elem[Din[m],index,esize];  op2val = Int(op2, unsigned);
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = Elem[Din[n+r],e,esize];  op1val = Int(op1, unsigned);
            if floating_point then
                Elem[D[d+r],e,esize] = FPMul(op1, op2, StandardFPSCRValue());
            else
                if long_destination then
                    Elem[Q[d>>1],e,2*esize] = (op1val*op2val)<2*esize-1:0>;
                else
                    Elem[D[d+r],e,esize] = (op1val*op2val)<esize-1:0>;
```

F6.1.143 VMVN (immediate)

Vector Bitwise NOT (immediate) places the bitwise inverse of an immediate integer constant into every element of the destination register.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

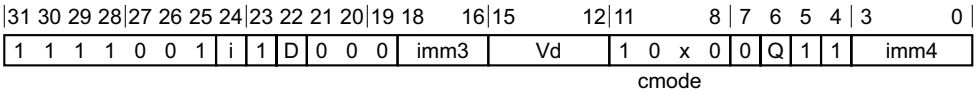
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VMVN{<c>}{<q>}.I32 <Dd>, #<imm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = NOT(imm64);
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

F6.1.144 VMVN (register)

Vector Bitwise NOT (register) takes a value from a register, inverts the value of each bit, and places the result in the destination register. The registers can be either doubleword or quadword.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

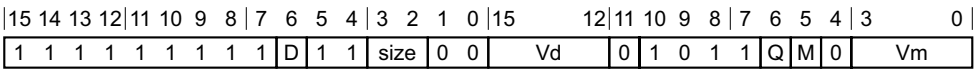
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VMVN{<c>}{<q>}{.<dt>} <Dd>, <Dm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VMVN{<c>}{<q>}{.<dt>} <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if size != '00' then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VMVN{<c>}{<q>}{.<dt>} <Dd>, <Dm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VMVN{<c>}{<q>}{.<dt>} <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if size != '00' then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

Assembler symbols

F6.1.145 VNEG

Vector Negate negates each element in a vector, and places the results in a second vector. The floating-point version only inverts the sign bit.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

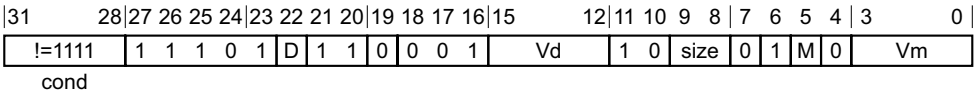
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VNEG{<c>}{<q>}.<dt> <Dd>, <Dm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VNEG{<c>}{<q>}.<dt> <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if size == '11' then UNDEFINED;
if F == '1' && ((size == '01' && !HaveFP16Ext()) || size == '00') then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
advsimd = TRUE;  floating_point = (F == '1');
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

A2

Half-precision scalar variant

Applies when `size == 01`.

```
VNEG{<c>}{<q>}.F16 <Sd>, <Sm>
```

Single-precision scalar variant

Applies when `size == 10`.

```
VNEG{<c>}{<q>}.F32 <Sd>, <Sm>
```

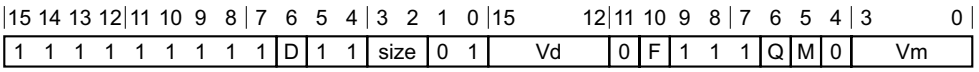
Double-precision scalar variant

Applies when `size == 11`.

```
VNEG{<c>}{<q>}.F64 <Dd>, <Dm>
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Decode for all variants of this encoding



```
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
if size == '01' && cond != '1110' then UNPREDICTABLE;
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
advsimd = FALSE;
case size of
    when '01' esize = 16; d = UInt(Vd:D); m = UInt(Vm:M);
    when '10' esize = 32; d = UInt(Vd:D); m = UInt(Vm:M);
    when '11' esize = 64; d = UInt(D:Vd); m = UInt(M:Vm);
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && cond != '1110'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VNEG{<c>}{<q>}.<dt> <Dd>, <Dm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VNEG{<c>}{<q>}.<dt> <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if size == '11' then UNDEFINED;

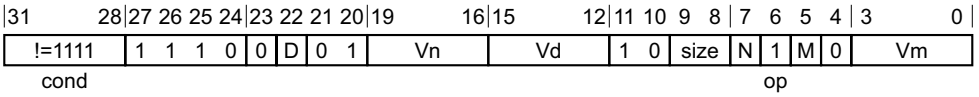
F6.1.146 VNMLA



Vector Negate Multiply Accumulate multiplies together two floating-point register values, adds the negation of the floating-point value in the destination register to the negation of the product, and writes the result back to the destination register.

Note

Arm recommends that software does not use the VNMLA instruction in the Round towards Plus Infinity and Round towards Minus Infinity rounding modes, because the rounding of the product and of the sum can change the result of the instruction in opposite directions, defeating the purpose of these rounding modes.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1

Half-precision scalar variant

Applies when size == 01.

```
VNMLA{<c>}{<q>}.F16 <Sd>, <Sn>, <Sm>
```

Single-precision scalar variant

Applies when size == 10.

```
VNMLA{<c>}{<q>}.F32 <Sd>, <Sn>, <Sm>
```

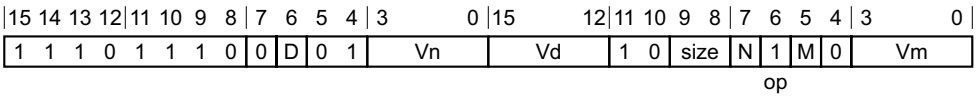
Double-precision scalar variant

Applies when size == 11.

```
VNMLA{<c>}{<q>}.F64 <Dd>, <Dn>, <Dm>
```

Decode for all variants of this encoding

```
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
if size == '01' && cond != '1110' then UNPREDICTABLE;
vtype = if op == '1' then VFPNegMul_VNMLA else VFPNegMul_VNMLS;
case size of
    when '01' esize = 16; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
    when '10' esize = 32; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
    when '11' esize = 64; d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
```



CONSTRAINED UNPREDICTABLE behavior

If size == '01' && cond != '1110', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
if size == '01' && InITBlock()  then UNPREDICTABLE;
vtype = if op == '1' then VFPNegMul_VNMLA else VFPNegMul_VNMLS;
case size of
    when '01' esize = 16; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
    when '10' esize = 32; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
    when '11' esize = 64; d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

F6.1.147 VNMLS

Vector Negate Multiply Subtract multiplies together two floating-point register values, adds the negation of the floating-point value in the destination register to the product, and writes the result back to the destination register.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1

Half-precision scalar variant

Applies when `size == 01`.

```
VNMLS{<c>}{<q>}.F16 <Sd>, <Sn>, <Sm>
```

Single-precision scalar variant

Applies when `size == 10`.

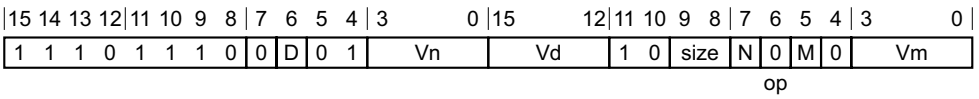
```
VNMLS{<c>}{<q>}.F32 <Sd>, <Sn>, <Sm>
```

Double-precision scalar variant

Applies when `size == 11`.

```
VNMLS{<c>}{<q>}.F64 <Dd>, <Dn>, <Dm>
```

Decode for all variants of this encoding



```
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
if size == '01' && cond != '1110' then UNPREDICTABLE;
vtype = if op == '1' then VFPNegMul_VNMLA else VFPNegMul_VNMLS;
case size of
    when '01' esize = 16; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
    when '10' esize = 32; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
    when '11' esize = 64; d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && cond != '1110'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

F6.1.149 VORN (immediate)

Vector Bitwise OR NOT (immediate) performs a bitwise OR between a register value and the complement of an immediate value, and returns the result into the destination vector

This instruction is a pseudo-instruction of the VORR (immediate) instruction. This means that:

- The encodings in this description are named to match the encodings of VORR (immediate).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VORR (immediate) gives the operational pseudocode for this instruction.

A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VORN{<c>}{<q>}.I16 {<Dd>,} <Dd>, #<imm>
```

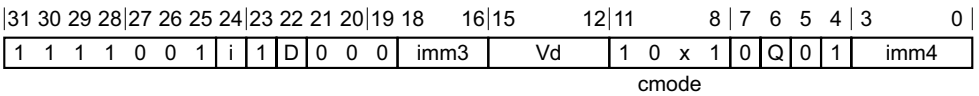
is equivalent to

```
VORR{<c>}{<q>}.I16 <Dd>, #~<imm>
```

and is never the preferred disassembly.

128-bit SIMD vector variant

Applies when `Q == 1`.



```
VORN{<c>}{<q>}.I16 {<Qd>,} <Qd>, #<imm>
```

is equivalent to

```
VORR{<c>}{<q>}.I16 <Qd>, #~<imm>
```

and is never the preferred disassembly.

A2

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VORN{<c>}{<q>}.I32 {<Dd>,} <Dd>, #<imm>
```

is equivalent to

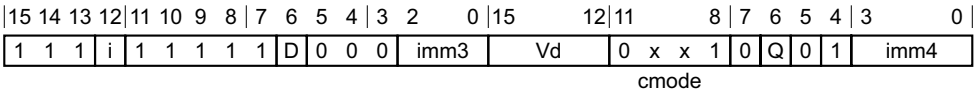
```
VORR{<c>}{<q>}.I32 <Dd>, #~<imm>
```

and is never the preferred disassembly.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

128-bit SIMD vector variant

Applies when `Q == 1`.



```
VORN{<c>}{<q>}.I32 {<Qd>,} <Qd>, #<imm>
```

is equivalent to

```
VORR{<c>}{<q>}.I32 <Qd>, #~<imm>
```

and is never the preferred disassembly.

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VORN{<c>}{<q>}.I16 {<Dd>,} <Dd>, #<imm>
```

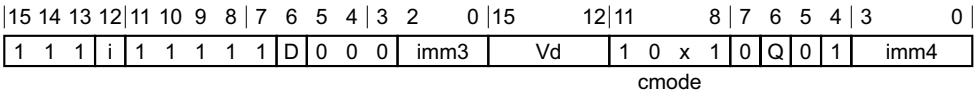
is equivalent to

```
VORR{<c>}{<q>}.I16 <Dd>, #~<imm>
```

and is never the preferred disassembly.

128-bit SIMD vector variant

Applies when `Q == 1`.



```
VORN{<c>}{<q>}.I16 {<Qd>,} <Qd>, #<imm>
```

is equivalent to

```
VORR{<c>}{<q>}.I16 <Qd>, #~<imm>
```

and is never the preferred disassembly.

T2

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VORN{<c>}{<q>}.I32 {<Dd>,} <Dd>, #<imm>
```

is equivalent to

```
VORR{<c>}{<q>}.I32 <Dd>, #~<imm>
```

and is never the preferred disassembly.

128-bit SIMD vector variant

Applies when `Q == 1`.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

`VORN{<c>}{<q>}.I32 {<Qd>,} <Qd>, #<imm>`

is equivalent to

`VORR{<c>}{<q>}.I32 <Qd>, #~<imm>`

and is never the preferred disassembly.

Assembler symbols

`<c>`	For encoding A1 and A2: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional. For encoding T1 and T2: see *Standard assembler syntax fields* on page F2-3660.
`<q>`	See *Standard assembler syntax fields* on page F2-3660.
`<Qd>`	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
`<Dd>`	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
`<imm>`	Is a constant of the specified type that is replicated to fill the destination register. For details of the range of constants available and the encoding of `<imm>`, see *Modified immediate constants in T32 and A32 Advanced SIMD instructions* on page F2-3677.

Operation for all encodings

The description of VORR (immediate) gives the operational pseudocode for this instruction.

F6.1.150 VORN (register)

Vector bitwise OR NOT (register) performs a bitwise OR NOT operation between two registers, and places the result in the destination register. The operand and result registers can be quadword or doubleword. They must all be the same size.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

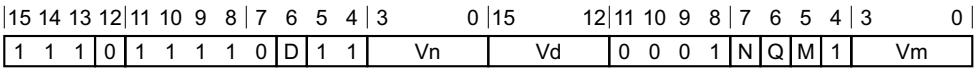
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VORN{<c>}{<q>}{.<dt>} {<Dd>,} <Dn>, <Dm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VORN{<c>}{<q>}{.<dt>} {<Qd>,} <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VORN{<c>}{<q>}{.<dt>} {<Dd>,} <Dn>, <Dm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VORN{<c>}{<q>}{.<dt>} {<Qd>,} <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<dt>` An optional data type. It is ignored by assemblers, and does not affect the encoding.

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Qn>` Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

`<Qm>` Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

`<Dn>` Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

`<Dm>` Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = D[n+r] OR NOT(D[m+r]);
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

F6.1.151 VORR (immediate)

Vector Bitwise OR (immediate) performs a bitwise OR between a register value and an immediate value, and returns the result into the destination vector.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

This instruction is used by the pseudo-instruction VORN (immediate). The pseudo-instruction is never the preferred disassembly.

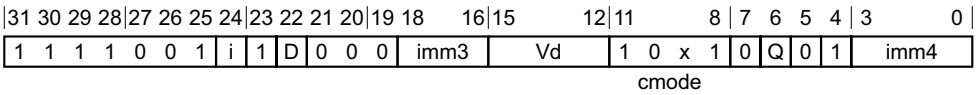
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VORR{<c>}{<q>}.I32 {<Dd>,} <Dd>, #<imm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VORR{<c>}{<q>}.I32 {<Qd>,} <Qd>, #<imm>
```

Decode for all variants of this encoding

```
if cmode<0> == '0' || cmode<3:2> == '11' then SEE "VMOV (immediate)";
if Q == '1' && Vd<0> == '1' then UNDEFINED;
imm64 = AdvSIMDExpandImm('0', cmode, i:imm3:imm4);
d = UInt(D:Vd);  regs = if Q == '0' then 1 else 2;
```

A2

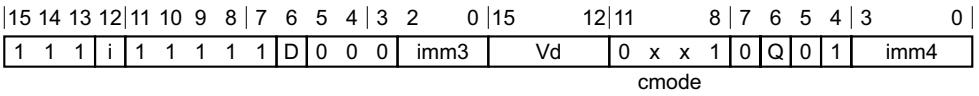
64-bit SIMD vector variant

Applies when `Q == 0`.

```
VORR{<c>}{<q>}.I16 {<Dd>,} <Dd>, #<imm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.



```
VORR{<c>}{<q>}.I16 {<Qd>,} <Qd>, #<imm>
```

Decode for all variants of this encoding

```
if cmode<0> == '0' || cmode<3:2> == '11' then SEE "VMOV (immediate)";
if Q == '1' && Vd<0> == '1' then UNDEFINED;
imm64 = AdvSIMDExpandImm('0', cmode, i:imm3:imm4);
d = UInt(D:Vd);  regs = if Q == '0' then 1 else 2;
```

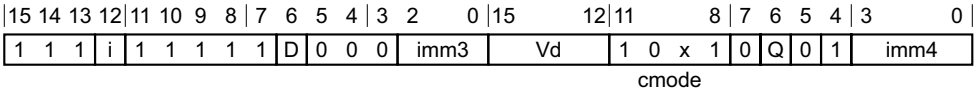
T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VORR{<c>}{<q>}.I32 {<Dd>,} <Dd>, #<imm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VORR{<c>}{<q>}.I32 {<Qd>,} <Qd>, #<imm>
```

Decode for all variants of this encoding

```
if cmode<0> == '0' || cmode<3:2> == '11' then SEE "VMOV (immediate)";
if Q == '1' && Vd<0> == '1' then UNDEFINED;
imm64 = AdvSIMDExpandImm('0', cmode, i:imm3:imm4);
d = UInt(D:Vd);  regs = if Q == '0' then 1 else 2;
```

T2

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VORR{<c>}{<q>}.I16 {<Dd>,} <Dd>, #<imm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VORR{<c>}{<q>}.I16 {<Qd>,} <Qd>, #<imm>
```

Decode for all variants of this encoding

```
if cmode<0> == '0' || cmode<3:2> == '11' then SEE "VMOV (immediate)";
if Q == '1' && Vd<0> == '1' then UNDEFINED;
imm64 = AdvSIMDExpandImm('0', cmode, i:imm3:imm4);
d = UInt(D:Vd);  regs = if Q == '0' then 1 else 2;
```

Assembler symbols

<c>	For encoding A1 and A2: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional. For encoding T1 and T2: see *Standard assembler syntax fields* on page F2-3660.
<q>	See *Standard assembler syntax fields* on page F2-3660.
<Qd>	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

<imm> Is a constant of the specified type that is replicated to fill the destination register. For details of the range of constants available and the encoding of <imm>, see *Modified immediate constants in T32 and A32 Advanced SIMD instructions* on page F2-3677.

The I8, I64, and F32 data types are permitted as pseudo-instructions, if the immediate can be represented by this instruction, and are encoded using a permitted encoding of the I16 or I32 data type.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = D[d+r] OR imm64;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

F6.1.152 VORR (register)

Vector bitwise OR (register) performs a bitwise OR operation between two registers, and places the result in the destination register. The operand and result registers can be quadword or doubleword. They must all be the same size.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

This instruction is used by the pseudo-instructions VMOV (register, SIMD), VRSHR (zero), and VSHR (zero). The pseudo-instruction is never the preferred disassembly.

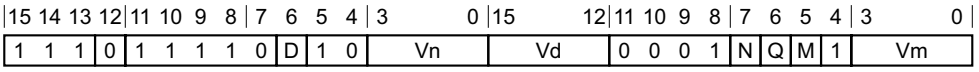
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VORR{<c>}{<q>}{.<dt>} {<Dd>,} <Dn>, <Dm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VORR{<c>}{<q>}{.<dt>} {<Qd>,} <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VORR{<c>}{<q>}{.<dt>} {<Dd>,} <Dn>, <Dm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VORR{<c>}{<q>}{.<dt>} {<Qd>,} <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

Alias conditions

Alias or pseudo-instruction	is preferred when
VMOV (register, SIMD)	N:Vn == M:Vm
VRSHR (zero)	Never
VSHR (zero)	Never

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<dt> An optional data type. It is ignored by assemblers, and does not affect the encoding.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = D[n+r] OR D[m+r];
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:

F6.1.153 VPADAL

Vector Pairwise Add and Accumulate Long adds adjacent pairs of elements of a vector, and accumulates the results into the elements of the destination vector.

The vectors can be doubleword or quadword. The operand elements can be 8-bit, 16-bit, or 32-bit integers. The result elements are twice the length of the operand elements.

The following figure shows the operation of VPADAL doubleword operation for data type S16.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

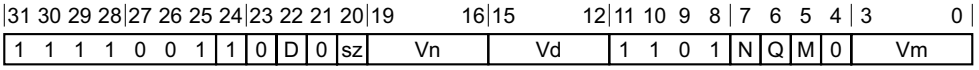
F6.1.154 VPADD (floating-point)



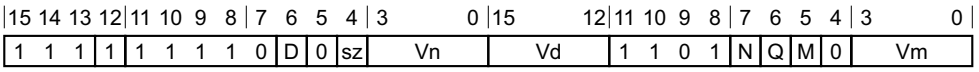
Vector Pairwise Add (floating-point) adds adjacent pairs of elements of two vectors, and places the results in the destination vector.

The operands and result are doubleword vectors.

The operand and result elements are floating-point numbers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1



A1 variant

```
VPADD{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

Decode for this encoding

```
if Q == '1' then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
case sz of
    when '0' esize = 32; elements = 2;
    when '1' esize = 16; elements = 4;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);
```

T1

T1 variant

```
VPADD{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

Decode for this encoding

```
if Q == '1' then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
if sz == '1' && InITBlock() then UNPREDICTABLE;
case sz of
    when '0' esize = 32; elements = 2;
    when '1' esize = 16; elements = 4;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);
```

CONSTRAINED UNPREDICTABLE behavior

If `sz == '1' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

F6.1.155 VPADD (integer)

Vector Pairwise Add (integer) adds adjacent pairs of elements of two vectors, and places the results in the destination vector.

The operands and result are doubleword vectors.

The operand and result elements must all be the same type, and can be 8-bit, 16-bit, or 32-bit integers. There is no distinction between signed and unsigned integers.

The following figure shows the operation of VPADD doubleword operation for data type I16.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

- op = 0, size = 11.
- op = 1, size = 11.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    h = elements DIV 2;

    for r = 0 to regs-1
        for e = 0 to h-1
            op1 = Elem[D[m+r],2*e,esize];  op2 = Elem[D[m+r],2*e+1,esize];
            result = Int(op1, unsigned) + Int(op2, unsigned);
            Elem[D[d+r],e,2*esize] = result<2*esize-1:0>;
```

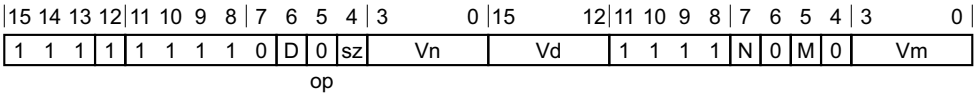
F6.1.157 VPMAX (floating-point)

Vector Pairwise Maximum compares adjacent pairs of elements in two doubleword vectors, and copies the larger of each pair into the corresponding element in the destination doubleword vector.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1



A1 variant

```
VPMAX{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

Decode for this encoding

```
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
maximum = (op == '0');
case sz of
    when '0' esize = 32; elements = 2;
    when '1' esize = 16; elements = 4;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);
```

T1

T1 variant

```
VPMAX{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

Decode for this encoding

```
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
if sz == '1' && InITBlock() then UNPREDICTABLE;
maximum = (op == '0');
case sz of
    when '0' esize = 32; elements = 2;
    when '1' esize = 16; elements = 4;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);
```

CONSTRAINED UNPREDICTABLE behavior

If `sz == '1' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

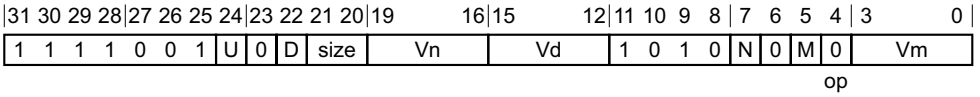
F6.1.158 VPMAX (integer)

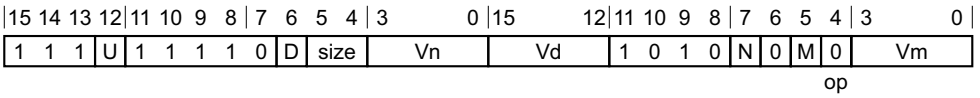


Vector Pairwise Maximum compares adjacent pairs of elements in two doubleword vectors, and copies the larger of each pair into the corresponding element in the destination doubleword vector.

The following figure shows the operation of VPMAX doubleword operation for data type S16 or U16.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1



A1 variant

```
VPMAX{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

Decode for this encoding

```
if size == '11' then UNDEFINED;
maximum = (op == '0');  unsigned = (U == '1');
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);
```

T1

T1 variant

```
VPMAX{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

Decode for this encoding

```
if size == '11' then UNDEFINED;
maximum = (op == '0');  unsigned = (U == '1');
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);
```

F6.1.161 VPOP

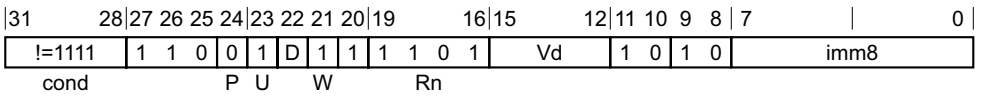
Pop SIMD&FP registers from Stack loads multiple consecutive Advanced SIMD and floating-point register file registers from the stack

This instruction is an alias of the VLDM, VLDMDB, VLDMIA instruction. This means that:

- The encodings in this description are named to match the encodings of VLDM, VLDMDB, VLDMIA.
- The description of VLDM, VLDMDB, VLDMIA gives the operational pseudocode for this instruction.

A1

Increment After variant



```
VPOP{<c>}{<q>}{.<size>} <dreglist>
```

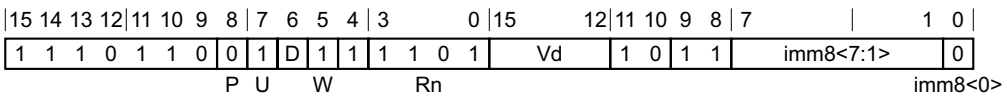
is equivalent to

```
VLDM{<c>}{<q>}{.<size>} SP!, <dreglist>
```

and is always the preferred disassembly.

A2

Increment After variant



```
VPOP{<c>}{<q>}{.<size>} <sreglist>
```

is equivalent to

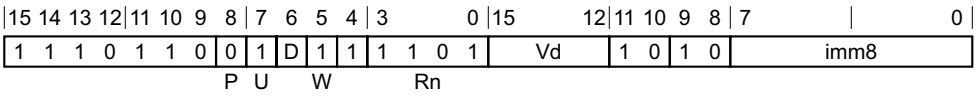
```
VLDM{<c>}{<q>}{.<size>} SP!, <sreglist>
```

and is always the preferred disassembly.

T1

Increment After variant

```
VPOP{<c>}{<q>}{.<size>} <dreglist>
```



is equivalent to

```
VLDM{<c>}{<q>}{.<size>} SP!, <dreglist>
```

and is always the preferred disassembly.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

T2

Increment After variant

`VPOP{<c>}{<q>}{.<size>} <sreglist>`

is equivalent to

`VLDM{<c>}{<q>}{.<size>} SP!, <sreglist>`

and is always the preferred disassembly.

Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<size>` An optional data size specifier. If present, it must be equal to the size in bits, 32 or 64, of the registers being transferred.

`<sreglist>` Is the list of consecutively numbered 32-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "Vd:D", and "imm8" is set to the number of registers in the list. The list must contain at least one register.

`<dreglist>` Is the list of consecutively numbered 64-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "D:Vd", and "imm8" is set to twice the number of registers in the list. The list must contain at least one register, and must not contain more than 16 registers.

Operation for all encodings

The description of VLDM, VLDMDB, VLDMIA gives the operational pseudocode for this instruction.

F6.1.162 VPUSH

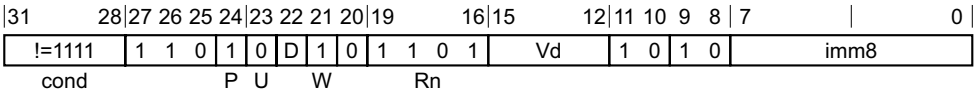
Push SIMD&FP registers to Stack stores multiple consecutive registers from the Advanced SIMD and floating-point register file to the stack

This instruction is an alias of the VSTM, VSTMDB, VSTMIA instruction. This means that:

- The encodings in this description are named to match the encodings of VSTM, VSTMDB, VSTMIA.
- The description of VSTM, VSTMDB, VSTMIA gives the operational pseudocode for this instruction.

A1

Decrement Before variant



```
VPUSH{<c>}{<q>}{.<size>} <dreglist>
```

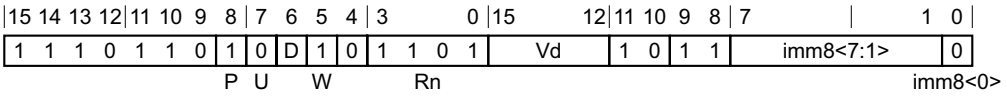
is equivalent to

```
VSTMDB{<c>}{<q>}{.<size>} SP!, <dreglist>
```

and is always the preferred disassembly.

A2

Decrement Before variant



```
VPUSH{<c>}{<q>}{.<size>} <sreglist>
```

is equivalent to

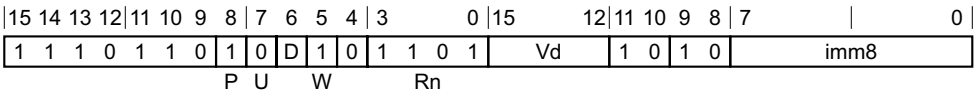
```
VSTMDB{<c>}{<q>}{.<size>} SP!, <sreglist>
```

and is always the preferred disassembly.

T1

Decrement Before variant

```
VPUSH{<c>}{<q>}{.<size>} <dreglist>
```



is equivalent to

```
VSTMDB{<c>}{<q>}{.<size>} SP!, <dreglist>
```

and is always the preferred disassembly.

F6.1.163 VQABS

Vector Saturating Absolute takes the absolute value of each element in a vector, and places the results in the destination vector.

If any of the results overflow, they are saturated. The cumulative saturation bit, FPSCR.QC, is set if saturation occurs. For details see *Pseudocode description of saturation* on page E1-3539.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

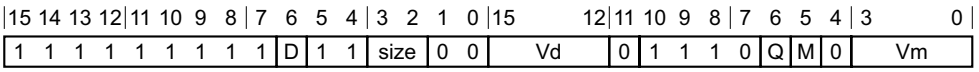
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VQABS{<c>}{<q>}.<dt> <Dd>, <Dm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VQABS{<c>}{<q>}.<dt> <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if size == '11' then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VQABS{<c>}{<q>}.<dt> <Dd>, <Dm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VQABS{<c>}{<q>}.<dt> <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if size == '11' then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<dt> Is the data type for the elements of the vectors, encoded in the "U:size" field. It can have the following values:

S8	when U = 0, size = 00
S16	when U = 0, size = 01
S32	when U = 0, size = 10
S64	when U = 0, size = 11
U8	when U = 1, size = 00
U16	when U = 1, size = 01
U32	when U = 1, size = 10
U64	when U = 1, size = 11

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            sum = Int(Elem[D[n+r],e,esize], unsigned) + Int(Elem[D[m+r],e,esize], unsigned);
            (Elem[D[d+r],e,esize], sat) = SatQ(sum, esize, unsigned);
            if sat then FPSCR.QC = '1';
```

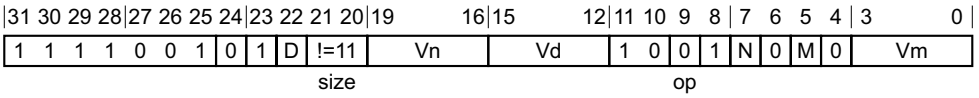
F6.1.165 VQDMLAL



Vector Saturating Doubling Multiply Accumulate Long multiplies corresponding elements in two doubleword vectors, doubles the products, and accumulates the results into the elements of a quadword vector.

The second operand can be a scalar instead of a vector. For more information about scalars see *Advanced SIMD scalars* on page F2-3686.

If any of the results overflow, they are saturated. The cumulative saturation bit, FPSCR.QC, is set if saturation occurs. For details see *Pseudocode description of saturation* on page E1-3539.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

Notes for all encodings

Related encodings: See *Advanced SIMD data-processing* on page F3-3713 for the T32 instruction set, or *Advanced SIMD data-processing* on page F4-3799 for the A32 instruction set.

Assembler symbols

`<c>` For encoding A1 and A2: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1 and T2: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<dt>` Is the data type for the elements of the operands, encoded in the "size" field. It can have the following values:

`S16` when `size = 01`

`S32` when `size = 10`

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Dn>` Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

`<Dm[x]>` Is the 64-bit name of the second SIMD&FP source register holding the scalar. If `<dt>` is `S16`, `Dm` is restricted to D0-D7. `Dm` is encoded in "Vm<2:0>", and `x` is encoded in "M:Vm<3>". If `<dt>` is `S32`, `Dm` is restricted to D0-D15. `Dm` is encoded in "Vm", and `x` is encoded in "M".

`<Dm>` Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

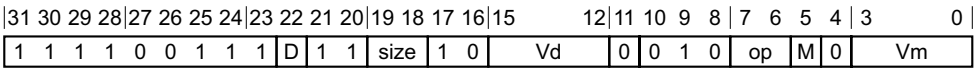
F6.1.169 VQMOVN, VQMOVUN

Vector Saturating Move and Narrow copies each element of the operand vector to the corresponding element of the destination vector.

The operand is a quadword vector. The elements can be any one of:

- 16-bit, 32-bit, or 64-bit signed integers.
- 16-bit, 32-bit, or 64-bit unsigned integers.



The result is a doubleword vector. The elements are half the length of the operand vector elements. If the operand is unsigned, the results are unsigned. If the operand is signed, the results can be signed or unsigned.

If any of the results overflow, they are saturated. The cumulative saturation bit, FPSCR.QC, is set if saturation occurs. For details see *Pseudocode description of saturation* on page E1-3539.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

This instruction is used by the pseudo-instructions VQRSHRN (zero), VQRSHRUN (zero), VQSHRN (zero), and VQSHRUN (zero). The pseudo-instruction is never the preferred disassembly.

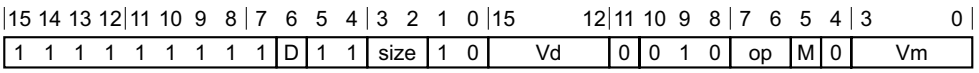
A1

Signed result variant

Applies when `op == 1x`.

```
VQMOVN{<c>}{<q>}.<dt> <Dd>, <Qm>
```

Unsigned result variant



Applies when `op == 01`.

```
VQMOVUN{<c>}{<q>}.<dt> <Dd>, <Qm>
```

Decode for all variants of this encoding

```
if op == '00' then SEE "VMOVN";
if size == '11' || Vm<0> == '1' then UNDEFINED;
src_unsigned = (op == '11');  dest_unsigned = (op<0> == '1');
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  m = UInt(M:Vm);
```

T1

Signed result variant

Applies when `op == 1x`.

```
VQMOVN{<c>}{<q>}.<dt> <Dd>, <Qm>
```

Non-Confidential

Unsigned result variant

Applies when op == 01.

```
VQMOVUN{<c>}{<q>}.<dt> <Dd>, <Qm>
```

Decode for all variants of this encoding

```
if op == '00' then SEE "VMOVN";
if size == '11' || Vm<0> == '1' then UNDEFINED;
src_unsigned = (op == '11');  dest_unsigned = (op<0> == '1');
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  m = UInt(M:Vm);
```

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<dt> For the signed result variant: is the data type for the elements of the operand, encoded in the "op<0>:size" field. It can have the following values:

S16 when op<0> = 0, size = 00

S32 when op<0> = 0, size = 01

S64 when op<0> = 0, size = 10

U16 when op<0> = 1, size = 00

U32 when op<0> = 1, size = 01

U64 when op<0> = 1, size = 10

The following encodings are reserved:

- op<0> = 0, size = 11.
- op<0> = 1, size = 11.

For the unsigned result variant: is the data type for the elements of the operand, encoded in the "size" field. It can have the following values:

S16 when size = 00

S32 when size = 01

S64 when size = 10

The encoding size = 11 is reserved.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for e = 0 to elements-1
        operand = Int(Elem[Qin[m>>1],e,2*esize], src_unsigned);
        (Elem[D[d],e,esize], sat) = SatQ(operand, esize, dest_unsigned);
        if sat then FPSCR.QC = '1';
```

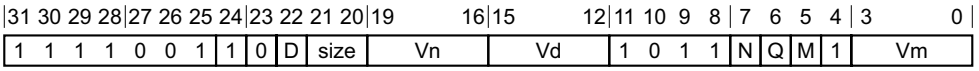
F6.1.171 VQRDMLAH



Vector Saturating Rounding Doubling Multiply Accumulate Returning High Half. This instruction multiplies the vector elements of the first source SIMD&FP register with either the corresponding vector elements of the second source SIMD&FP register or the value of a vector element of the second source SIMD&FP register, without saturating the multiply results, doubles the results, and accumulates the most significant half of the final results with the vector elements of the destination SIMD&FP register. The results are rounded.

If any of the results overflow, they are saturated. The cumulative saturation bit, FPSCR.QC, is set if saturation occurs. For details see *Pseudocode description of saturation* on page E1-3539.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

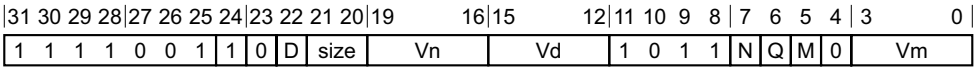
F6.1.173 VQRDMULH



Vector Saturating Rounding Doubling Multiply Returning High Half multiplies corresponding elements in two vectors, doubles the results, and places the most significant half of the final results in the destination vector. The results are rounded. For truncated results see VQDMULH.

The second operand can be a scalar instead of a vector. For more information about scalars see *Advanced SIMD scalars* on page F2-3686.

If any of the results overflow, they are saturated. The cumulative saturation bit, FPSCR.QC, is set if saturation occurs. For details see *Pseudocode description of saturation* on page E1-3539.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

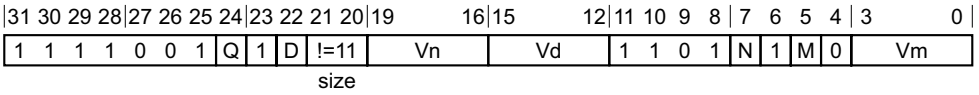
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VQRDMULH{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VQRDMULH{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;

Notes for all encodings

Related encodings: See *Advanced SIMD data-processing* on page F3-3713 for the T32 instruction set, or *Advanced SIMD data-processing* on page F4-3799 for the A32 instruction set.

Assembler symbols

`<c>` For encoding A1 and A2: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1 and T2: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<dt>` Is the data type for the elements of the operands, encoded in the "size" field. It can have the following values:

`S16` when `size = 01`

`S32` when `size = 10`

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Qn>` Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

`<Qm>` Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

`<Dn>` Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

`<Dm[x]>` Is the 64-bit name of the second SIMD&FP source register holding the scalar. If `<dt>` is `S16`, `Dm` is restricted to D0-D7. `Dm` is encoded in "Vm<2:0>", and `x` is encoded in "M:Vm<3>". If `<dt>` is `S32`, `Dm` is restricted to D0-D15. `Dm` is encoded in "Vm", and `x` is encoded in "M".

`<Dm>` Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    round_const = 1 << (esize-1);
    if scalar_form then op2 = SInt(Elem[D[m],index,esize]);
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = SInt(Elem[D[n+r],e,esize]);
            if !scalar_form then op2 = SInt(Elem[D[m+r],e,esize]);
            (result, sat) = SignedSatQ((2*op1*op2 + round_const) >> esize, esize);
            Elem[D[d+r],e,esize] = result;
            if sat then FPSCR.QC = '1';
```

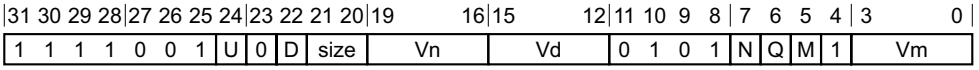
F6.1.174 VQRSHL

Vector Saturating Rounding Shift Left takes each element in a vector, shifts them by a value from the least significant byte of the corresponding element of a second vector, and places the results in the destination vector. If the shift value is positive, the operation is a left shift. Otherwise, it is a right shift.

For truncated results see VQSHL (register).

The first operand and result elements are the same data type, and can be any one of:



- 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
- 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

The second operand is a signed integer of the same size.

If any of the results overflow, they are saturated. The cumulative saturation bit, FPSCR.QC, is set if saturation occurs. For details see *Pseudocode description of saturation* on page E1-3539.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

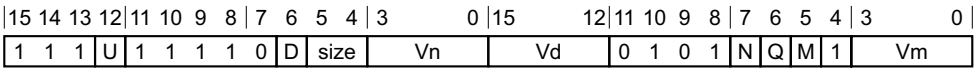
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VQRSHL{<c>}{<q>}.<dt> {<Dd>,} <Dm>, <Dn>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VQRSHL{<c>}{<q>}.<dt> {<Qd>,} <Qm>, <Qn>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1' || Vn<0> == '1') then UNDEFINED;
unsigned = (U == '1');
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  m = UInt(M:Vm);  n = UInt(N:Vn);  regs = if Q == '0' then 1 else 2;
```

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VQRSHL{<c>}{<q>}.<dt> {<Dd>,} <Dm>, <Dn>
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

128-bit SIMD vector variant

Applies when Q == 1.

```
VQRSHL{<c>}{<q>}.<dt> {<Qd>,} <Qm>, <Qn>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1' || Vn<0> == '1') then UNDEFINED;
unsigned = (U == '1');
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  m = UInt(M:Vm);  n = UInt(N:Vn);  regs = if Q == '0' then 1 else 2;
```

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<dt> Is the data type for the elements of the vectors, encoded in the "U:size" field. It can have the following values:

S8	when U = 0, size = 00
S16	when U = 0, size = 01
S32	when U = 0, size = 10
S64	when U = 0, size = 11
U8	when U = 1, size = 00
U16	when U = 1, size = 01
U32	when U = 1, size = 10
U64	when U = 1, size = 11

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            shift = SInt(Elem[D[n+r],e,esize]<7:0>);
            round_const = 1 << (-1-shift); // 0 for left shift, 2^(n-1) for right shift
            operand = Int(Elem[D[m+r],e,esize], unsigned);
            (result, sat) = SatQ((operand + round_const) << shift, esize, unsigned);
            Elem[D[d+r],e,esize] = result;
            if sat then FPSCR.QC = '1';
```

F6.1.175 VQRSHRN (zero)

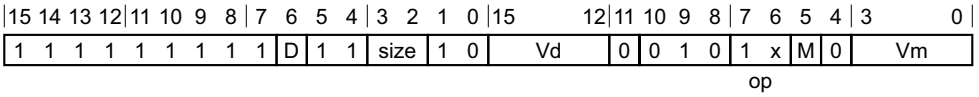
Vector Saturating Rounding Shift Right, Narrow takes each element in a quadword vector of integers, right shifts them by an immediate value, and places the signed rounded results in a doubleword vector

This instruction is a pseudo-instruction of the VQMOVN, VQMOVUN instruction. This means that:

- The encodings in this description are named to match the encodings of VQMOVN, VQMOVUN.
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VQMOVN, VQMOVUN gives the operational pseudocode for this instruction.

A1

Signed result variant



```
VQRSHRN{<c>}{<q>}.<dt> <Dd>, <Qm>, #0
```

is equivalent to

```
VQMOVN{<c>}{<q>}.<dt> <Dd>, <Qm>
```

and is never the preferred disassembly.

T1

Signed result variant

```
VQRSHRN{<c>}{<q>}.<dt> <Dd>, <Qm>, #0
```

is equivalent to

```
VQMOVN{<c>}{<q>}.<dt> <Dd>, <Qm>
```

and is never the preferred disassembly.

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<dt> Is the data type for the elements of the operand, encoded in the "op<0>:size" field. It can have the following values:

- S16 when op<0> = 0, size = 00
- S32 when op<0> = 0, size = 01
- S64 when op<0> = 0, size = 10
- U16 when op<0> = 1, size = 00

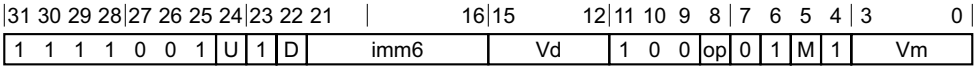
F6.1.176 VQRSHRN, VQRSHRUN

Vector Saturating Rounding Shift Right, Narrow takes each element in a quadword vector of integers, right shifts them by an immediate value, and places the rounded results in a doubleword vector.

For truncated results, see VQSHL (register).

The operand elements must all be the same size, and can be any one of:



- 16-bit, 32-bit, or 64-bit signed integers.
- 16-bit, 32-bit, or 64-bit unsigned integers.

The result elements are half the width of the operand elements. If the operand elements are signed, the results can be either signed or unsigned. If the operand elements are unsigned, the result elements must also be unsigned.

If any of the results overflow, they are saturated. The cumulative saturation bit, FPSCR.QC, is set if saturation occurs. For details see *Pseudocode description of saturation* on page E1-3539.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

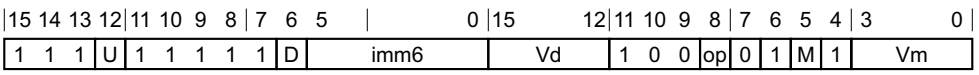
A1

Signed result variant

Applies when `!(imm6 == 000xxx) && op == 1`.

```
VQRSHRN{<c>}{<q>}.<type><size> <Dd>, <Qm>, #<imm>
```

Unsigned result variant



Applies when `U == 1 && !(imm6 == 000xxx) && op == 0`.

```
VQRSHRUN{<c>}{<q>}.<type><size> <Dd>, <Qm>, #<imm>
```

Decode for all variants of this encoding

```
if imm6 == '000xxx' then SEE "Related encodings";
if U == '0' && op == '0' then SEE "VRSHRN";
if Vm<0> == '1' then UNDEFINED;
case imm6 of
    when '001xxx'  esize = 8;  elements = 8;  shift_amount = 16 - UInt(imm6);
    when '01xxxx'  esize = 16;  elements = 4;  shift_amount = 32 - UInt(imm6);
    when '1xxxxx'  esize = 32;  elements = 2;  shift_amount = 64 - UInt(imm6);
src_unsigned = (U == '1' && op == '1');  dest_unsigned = (U == '1');
d = UInt(D:Vd);  m = UInt(M:Vm);
```

T1

Signed result variant

Applies when `!(imm6 == 000xxx) && op == 1`.

if Vm<0> == '1' then UNDEFINED;
case imm6 of
    when '001xxx'  esize = 8;  elements = 8;  shift_amount = 16 - UInt(imm6);
    when '01xxxx'  esize = 16;  elements = 4;  shift_amount = 32 - UInt(imm6);
    when '1xxxxx'  esize = 32;  elements = 2;  shift_amount = 64 - UInt(imm6);
src_unsigned = (U == '1' && op == '1');  dest_unsigned = (U == '1');
d = UInt(D:Vd);  m = UInt(M:Vm);
```

Notes for all encodings

Related encodings: See *Advanced SIMD one register and modified immediate* on page F3-3722 for the T32 instruction set, or *Advanced SIMD one register and modified immediate* on page F4-3807 for the A32 instruction set.

Assembler symbols

`<c>` For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<type>` For the signed result variant: is the data type for the elements of the vectors, encoded in the "U" field. It can have the following values:

- `S` when `U = 0`
- `U` when `U = 1`

For the unsigned result variant: is the data type for the elements of the vectors, encoded in the "U" field. It can have the following values:

- `S` when `U = 1`

`<size>` Is the data size for the elements of the vectors, encoded in the "imm6<5:3>" field. It can have the following values:

- `16` when `imm6<5:3> = 001`
- `32` when `imm6<5:3> = 01x`
- `64` when `imm6<5:3> = 1xx`

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

`<Qm>` Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

`<imm>` Is an immediate value, in the range 1 to `<size>`/2, encoded in the "imm6" field as `<size>`/2 - `<imm>`.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    round_const = 1 << (shift_amount - 1);
    for e = 0 to elements-1
```

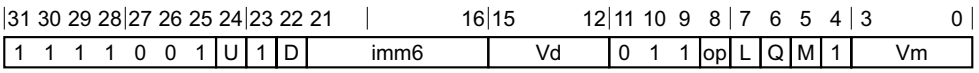
F6.1.178 VQSHL, VQSHLU (immediate)

Vector Saturating Shift Left (immediate) takes each element in a vector of integers, left shifts them by an immediate value, and places the results in a second vector.

The operand elements must all be the same size, and can be any one of:



- 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
- 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

The result elements are the same size as the operand elements. If the operand elements are signed, the results can be either signed or unsigned. If the operand elements are unsigned, the result elements must also be unsigned.

If any of the results overflow, they are saturated. The cumulative saturation bit, FPSCR.QC, is set if saturation occurs. For details see *Pseudocode description of saturation* on page E1-3539.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1

VQSHL,double,signed-result variant

Applies when `!(imm6 == 000xxx && L == 0) && op == 1 && Q == 0`.

```
VQSHL{<c>}{<q>}.<type><size> {<Dd>,} <Dm>, #<imm>
```

VQSHL,quad,signed-result variant

Applies when `!(imm6 == 000xxx && L == 0) && op == 1 && Q == 1`.

```
VQSHL{<c>}{<q>}.<type><size> {<Qd>,} <Qm>, #<imm>
```

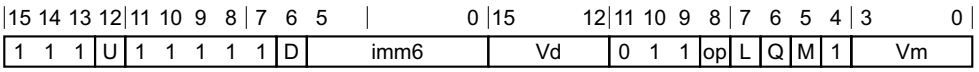
VQSHLU,double,unsigned-result variant

Applies when `U == 1 && !(imm6 == 000xxx && L == 0) && op == 0 && Q == 0`.

```
VQSHLU{<c>}{<q>}.<type><size> {<Dd>,} <Dm>, #<imm>
```

VQSHLU,quad,unsigned-result variant

Applies when `U == 1 && !(imm6 == 000xxx && L == 0) && op == 0 && Q == 1`.



```
VQSHLU{<c>}{<q>}.<type><size> {<Qd>,} <Qm>, #<imm>
```

Decode for all variants of this encoding

```
if (L:imm6) == '0000xxx' then SEE "Related encodings";
if U == '0' && op == '0' then UNDEFINED;

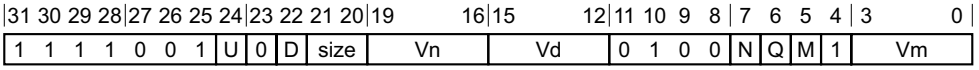
F6.1.179 VQSHL (register)

Vector Saturating Shift Left (register) takes each element in a vector, shifts them by a value from the least significant byte of the corresponding element of a second vector, and places the results in the destination vector. If the shift value is positive, the operation is a left shift. Otherwise, it is a right shift.

The results are truncated. For rounded results, see VQRSHL.

The first operand and result elements are the same data type, and can be any one of:



- 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
- 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

The second operand is a signed integer of the same size.

If any of the results overflow, they are saturated. The cumulative saturation bit, FPSCR.QC, is set if saturation occurs. For details see *Pseudocode description of saturation* on page E1-3539.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VQSHL{<c>}{<q>}.<dt> {<Dd>,} <Dm>, <Dn>

F6.1.180 VQSHRN (zero)

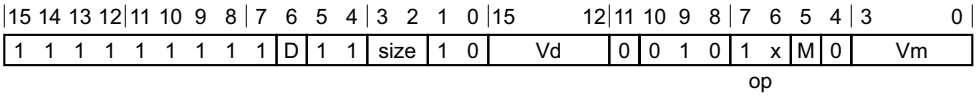
Vector Saturating Shift Right, Narrow takes each element in a quadword vector of integers, right shifts them by an immediate value, and places the signed truncated results in a doubleword vector

This instruction is a pseudo-instruction of the VQMOVN, VQMOVUN instruction. This means that:

- The encodings in this description are named to match the encodings of VQMOVN, VQMOVUN.
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VQMOVN, VQMOVUN gives the operational pseudocode for this instruction.

A1

Signed result variant



```
VQSHRN{<c>}{<q>}.<dt> <Dd>, <Qm>, #0
```

is equivalent to

```
VQMOVN{<c>}{<q>}.<dt> <Dd>, <Qm>
```

and is never the preferred disassembly.

T1

Signed result variant

```
VQSHRN{<c>}{<q>}.<dt> <Dd>, <Qm>, #0
```

is equivalent to

```
VQMOVN{<c>}{<q>}.<dt> <Dd>, <Qm>
```

and is never the preferred disassembly.

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<dt> Is the data type for the elements of the operand, encoded in the "op<0>:size" field. It can have the following values:

- S16 when op<0> = 0, size = 00
- S32 when op<0> = 0, size = 01
- S64 when op<0> = 0, size = 10
- U16 when op<0> = 1, size = 00

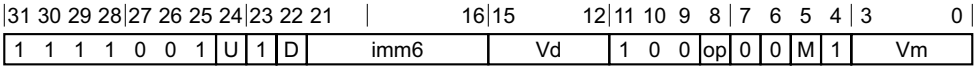
F6.1.181 VQSHRN, VQSHRUN

Vector Saturating Shift Right, Narrow takes each element in a quadword vector of integers, right shifts them by an immediate value, and places the truncated results in a doubleword vector.

For rounded results, see VQRSHRN, VQRSHRUN.

The operand elements must all be the same size, and can be any one of:



- 16-bit, 32-bit, or 64-bit signed integers.
- 16-bit, 32-bit, or 64-bit unsigned integers.

The result elements are half the width of the operand elements. If the operand elements are signed, the results can be either signed or unsigned. If the operand elements are unsigned, the result elements must also be unsigned.

If any of the results overflow, they are saturated. The cumulative saturation bit, FPSCR.QC, is set if saturation occurs. For details see *Pseudocode description of saturation* on page E1-3539.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1

Signed result variant

Applies when `!(imm6 == 000xxx) && op == 1`.

```
VQSHRN{<c>}{<q>}.<type><size> <Dd>, <Qm>, #<imm>
```

Unsigned result variant

<dt> Is the data type for the elements of the operands, encoded in the "size" field. It can have the following values:

I16 when size = 00

I32 when size = 01

I64 when size = 10

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    round_const = 1 << (esize-1);
    for e = 0 to elements-1
        result = Elem[Qin[n>>1],e,2*esize] + Elem[Qin[m>>1],e,2*esize] + round_const;
        Elem[D[d],e,esize] = result<2*esize-1:esize>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

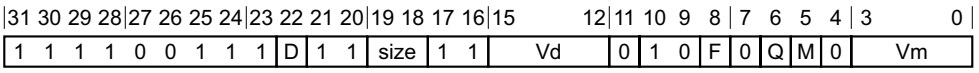
F6.1.185 VRECPE



Vector Reciprocal Estimate finds an approximate reciprocal of each element in the operand vector, and places the results in the destination vector.

The operand and result elements are the same type, and can be floating-point numbers or unsigned integers.

For details of the operation performed by this instruction see *Floating-point reciprocal square root estimate and step* on page E1-3557.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

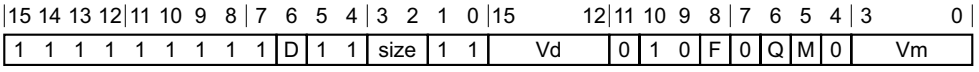
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VRECPE{<c>}{<q>}.<dt> <Dd>, <Dm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VRECPE{<c>}{<q>}.<dt> <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
if (size == '01' && !HaveFP16Ext()) || size IN {'00', '11'} then UNDEFINED;
floating_point = (F == '1');
case size of
    when '01' esize = 16; elements = 4;
    when '10' esize = 32; elements = 2;
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VRECPE{<c>}{<q>}.<dt> <Dd>, <Dm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VRECPE{<c>}{<q>}.<dt> <Qd>, <Qm>
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
if (size == '01' && !HaveFP16Ext()) || size IN {'00', '11'} then UNDEFINED;
if size == '01' && InITBlock()  then UNPREDICTABLE;
floating_point = (F == '1');
case size of
    when '01' esize = 16; elements = 4;
    when '10' esize = 32; elements = 2;
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

`<c>` For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<dt>` Is the data type for the elements of the vectors, encoded in the "F:size" field. It can have the following values:

`U32`	when `F = 0, size = 10`
`F16`	when `F = 1, size = 01`
`F32`	when `F = 1, size = 10`

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Qm>` Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

`<Dm>` Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Newton-Raphson iteration

For details of the operation performed and how it can be used in a Newton-Raphson iteration to calculate the reciprocal of a number, see *Floating-point reciprocal estimate and step* on page E1-3556.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            if floating_point then
                Elem[D[d+r],e,esize] = FPRecipEstimate(Elem[D[m+r],e,esize], StandardFPSCRValue());
            else
                Elem[D[d+r],e,esize] = UnsignedRecipEstimate(Elem[D[m+r],e,esize]);
```

            for e = 0 to elements_per_container-1
                Elem[result, rev_element, esize] = Elem[D[m+r], element, esize];
                element = element + 1;
                rev_element = rev_element - 1;
        D[d+r] = result;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

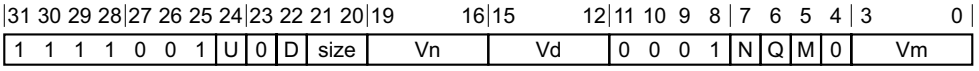
F6.1.190 VRHADD

Vector Rounding Halving Add adds corresponding elements in two vectors of integers, shifts each result right one bit, and places the final results in the destination vector.



The operand and result elements are all the same type, and can be any one of:

- 8-bit, 16-bit, or 32-bit signed integers.
- 8-bit, 16-bit, or 32-bit unsigned integers.

The results of the halving operations are rounded. For truncated results, see VHADD.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

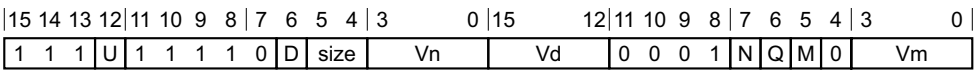
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VRHADD{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VRHADD{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if size == '11' then UNDEFINED;
unsigned = (U == '1');
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VRHADD{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VRHADD{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if size == '11' then UNDEFINED;
unsigned = (U == '1');
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<dt> Is the data type for the elements of the operands, encoded in the "U:size" field. It can have the following values:

S8	when U = 0, size = 00
S16	when U = 0, size = 01
S32	when U = 0, size = 10
U8	when U = 1, size = 00
U16	when U = 1, size = 01
U32	when U = 1, size = 10

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = Int(Elem[D[n+r],e,esize], unsigned);
            op2 = Int(Elem[D[m+r],e,esize], unsigned);
            result = op1 + op2 + 1;
            Elem[D[d+r],e,esize] = result<esize:1>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.

F6.1.191 VRINTA (Advanced SIMD)

Vector Round floating-point to integer towards Nearest with Ties to Away rounds a vector of floating-point values to integral floating-point values of the same size using the Round to Nearest with Ties to Away rounding mode. A zero input gives a zero result with the same sign, an infinite input gives an infinite result with the same sign, and a NaN is propagated as for normal arithmetic.

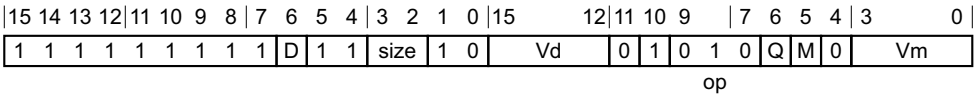
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VRINTA{<q>}.<dt> <Dd>, <Dm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VRINTA{<q>}.<dt> <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if op<2> != op<0> then SEE "Related encodings";
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
if (size == '01' && !HaveFP16Ext()) || size IN {'00', '11'} then UNDEFINED;
// Rounding encoded differently from other VCVT and VRINT instructions
rounding = FPDecodeRM(op<2>:NOT(op<1>));  exact = FALSE;
case size of
    when '01' esize = 16; elements = 4;
    when '10' esize = 32; elements = 2;
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VRINTA{<q>}.<dt> <Dd>, <Dm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VRINTA{<q>}.<dt> <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if op<2> != op<0> then SEE "Related encodings";
if InITBlock() then UNPREDICTABLE;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
if (size == '01' && !HaveFP16Ext()) || size IN {'00', '11'} then UNDEFINED;
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

```
// Rounding encoded differently from other VCVT and VRINT instructions
rounding = FPDecodeRM(op<2>:NOT(op<1>));  exact = FALSE;
case size of
    when '01' esize = 16; elements = 4;
    when '10' esize = 32; elements = 2;
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

CONSTRAINED UNPREDICTABLE behavior

If `InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Notes for all encodings

Related encodings: See *Advanced SIMD two registers misc* on page F3-3717 for the T32 instruction set, or *Advanced SIMD two registers misc* on page F4-3802 for the A32 instruction set.

Assembler symbols

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<dt>` Is the data type for the elements of the vectors, encoded in the "size" field. It can have the following values:

`F16`	when `size = 01`
`F32`	when `size = 10`

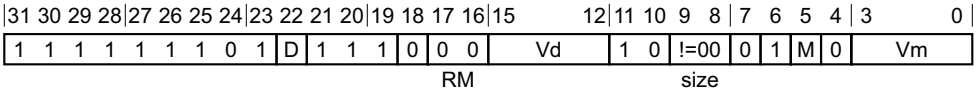
`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Qm>` Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

`<Dm>` Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings



```
EncodingSpecificOperations(); CheckAdvSIMDEnabled();
for r = 0 to regs-1
    for e = 0 to elements-1
        op1 = Elem[D[m+r],e,esize];
        result = FPRoundInt(op1, StandardFPSCRValue(), rounding, exact);
        Elem[D[d+r],e,esize] = result;
```

F6.1.196 VRINTN (floating-point)

Round floating-point to integer to Nearest rounds a floating-point value to an integral floating-point value of the same size using the Round to Nearest rounding mode. A zero input gives a zero result with the same sign, an infinite input gives an infinite result with the same sign, and a NaN is propagated as for normal arithmetic.

A1

Half-precision scalar variant

Applies when `size == 01`.

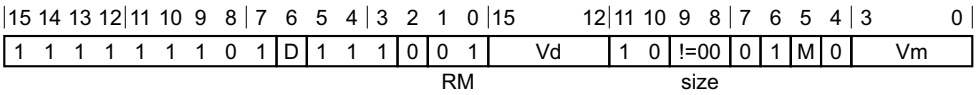
```
VRINTN{<q>}.F16 <Sd>, <Sm>
```

Single-precision scalar variant

Applies when `size == 10`.

```
VRINTN{<q>}.F32 <Sd>, <Sm>
```

Double-precision scalar variant



Applies when `size == 11`.

```
VRINTN{<q>}.F64 <Dd>, <Dm>
```

Decode for all variants of this encoding

```
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
rounding = FPDecodeRM(RM);  exact = FALSE;
case size of
    when '01' esize = 16; d = UInt(Vd:D); m = UInt(Vm:M);
    when '10' esize = 32; d = UInt(Vd:D); m = UInt(Vm:M);
    when '11' esize = 64; d = UInt(D:Vd); m = UInt(M:Vm);
```

T1

Half-precision scalar variant

Applies when `size == 01`.

```
VRINTN{<q>}.F16 <Sd>, <Sm>
```

Single-precision scalar variant

Applies when `size == 10`.

```
VRINTN{<q>}.F32 <Sd>, <Sm>
```

Double-precision scalar variant

Applies when `size == 11`.

```
VRINTN{<q>}.F64 <Dd>, <Dm>
```

Non-Confidential

Decode for all variants of this encoding

```
if InITBlock() then UNPREDICTABLE;
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
rounding = FPDecodeRM(RM);  exact = FALSE;
case size of
    when '01' esize = 16; d = UInt(Vd:D); m = UInt(Vm:M);
    when '10' esize = 32; d = UInt(Vd:D); m = UInt(Vm:M);
    when '11' esize = 64; d = UInt(D:Vd); m = UInt(M:Vm);
```

CONSTRAINED UNPREDICTABLE behavior

If `InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

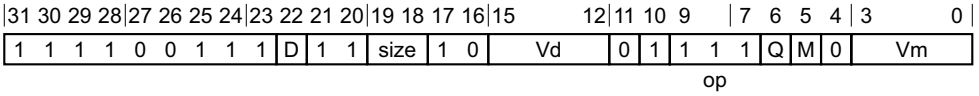
Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<q>`	See *Standard assembler syntax fields* on page F2-3660.
`<Sd>`	Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.
`<Sm>`	Is the 32-bit name of the SIMD&FP source register, encoded in the "Vm:M" field.
`<Dd>`	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
`<Dm>`	Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings



```
EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
case esize of
    when 16
        S[d] = Zeros(16) : FPRoundInt(S[m]<15:0>, FPSCR, rounding, exact);
    when 32
        S[d] = FPRoundInt(S[m], FPSCR, rounding, exact);
    when 64
        D[d] = FPRoundInt(D[m], FPSCR, rounding, exact);
```

```
    when '10' esize = 32; elements = 2;
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
if InITBlock() then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<dt>` Is the data type for the elements of the vectors, encoded in the "size" field. It can have the following values:

`F16`	when `size = 01`
`F32`	when `size = 10`

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Qm>` Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

`<Dm>` Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
EncodingSpecificOperations(); CheckAdvSIMDEnabled();
for r = 0 to regs-1
    for e = 0 to elements-1
        op1 = Elem[D[m+r],e,esize];
        result = FPRoundInt(op1, StandardFPSCRValue(), rounding, exact);
        Elem[D[d+r],e,esize] = result;
```

F6.1.203 VRINTZ (floating-point)

Round floating-point to integer towards Zero rounds a floating-point value to an integral floating-point value of the same size, using the Round towards Zero rounding mode. A zero input gives a zero result with the same sign, an infinite input gives an infinite result with the same sign, and a NaN is propagated as for normal arithmetic.

A1

Half-precision scalar variant

Applies when `size == 01`.

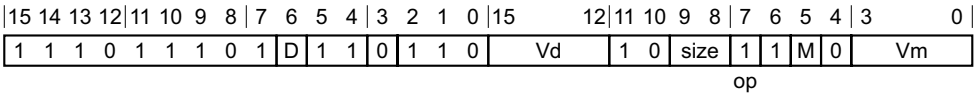
```
VRINTZ{<c>}{<q>}.F16 <Sd>, <Sm>
```

Single-precision scalar variant

Applies when `size == 10`.

```
VRINTZ{<c>}{<q>}.F32 <Sd>, <Sm>
```

Double-precision scalar variant



Applies when `size == 11`.

```
VRINTZ{<c>}{<q>}.F64 <Dd>, <Dm>
```

Decode for all variants of this encoding

```
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
if size == '01' && cond != '1110' then UNPREDICTABLE;
rounding = if op == '1' then FPRounding_ZERO else FPRoundingMode(FPSCR);
exact = FALSE;
case size of
    when '01' esize = 16; d = UInt(Vd:D); m = UInt(Vm:M);
    when '10' esize = 32; d = UInt(Vd:D); m = UInt(Vm:M);
    when '11' esize = 64; d = UInt(D:Vd); m = UInt(M:Vm);
```

T1

Half-precision scalar variant

Applies when `size == 01`.

```
VRINTZ{<c>}{<q>}.F16 <Sd>, <Sm>
```

Single-precision scalar variant

Applies when `size == 10`.

```
VRINTZ{<c>}{<q>}.F32 <Sd>, <Sm>
```

Double-precision scalar variant

Applies when `size == 11`.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

```
VRINTZ{<c>}{<q>}.F64 <Dd>, <Dm>
```

Decode for all variants of this encoding

```
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
if size == '01' && InITBlock()  then UNPREDICTABLE;
rounding = if op == '1' then FPRounding_ZERO else FPRoundingMode(FPSCR);
exact = FALSE;
case size of
    when '01' esize = 16; d = UInt(Vd:D); m = UInt(Vm:M);
    when '10' esize = 32; d = UInt(Vd:D); m = UInt(Vm:M);
    when '11' esize = 64; d = UInt(D:Vd); m = UInt(M:Vm);
```

CONSTRAINED UNPREDICTABLE behavior

If `InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

`<c>`	See *Standard assembler syntax fields* on page F2-3660.
`<q>`	See *Standard assembler syntax fields* on page F2-3660.
`<Sd>`	Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.
`<Sm>`	Is the 32-bit name of the SIMD&FP source register, encoded in the "Vm:M" field.
`<Dd>`	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
`<Dm>`	Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
    case esize of
        when 16
            S[d] = Zeros(16) : FPRoundInt(S[m]<15:0>, FPSCR, rounding, exact);
        when 32
            S[d] = FPRoundInt(S[m], FPSCR, rounding, exact);
        when 64
            D[d] = FPRoundInt(D[m], FPSCR, rounding, exact);
```

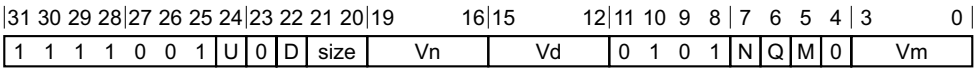
F6.1.204 VRSHL

Vector Rounding Shift Left takes each element in a vector, shifts them by a value from the least significant byte of the corresponding element of a second vector, and places the results in the destination vector. If the shift value is positive, the operation is a left shift. If the shift value is negative, it is a rounding right shift. For a truncating shift, see VSHL.



The first operand and result elements are the same data type, and can be any one of:

- 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
- 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

The second operand is always a signed integer of the same size.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

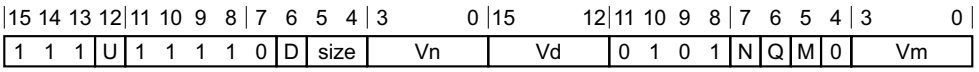
A1

64-bit SIMD vector variant

Applies when Q == 0.

```
VRSHL{<c>}{<q>}.<dt> {<Dd>,} <Dm>, <Dn>
```

128-bit SIMD vector variant



Applies when Q == 1.

```
VRSHL{<c>}{<q>}.<dt> {<Qd>,} <Qm>, <Qn>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1' || Vn<0> == '1') then UNDEFINED;
unsigned = (U == '1');
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  m = UInt(M:Vm);  n = UInt(N:Vn);  regs = if Q == '0' then 1 else 2;
```

T1

64-bit SIMD vector variant

Applies when Q == 0.

```
VRSHL{<c>}{<q>}.<dt> {<Dd>,} <Dm>, <Dn>
```

128-bit SIMD vector variant

Applies when Q == 1.

```
VRSHL{<c>}{<q>}.<dt> {<Qd>,} <Qm>, <Qn>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1' || Vn<0> == '1') then UNDEFINED;
unsigned = (U == '1');
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  m = UInt(M:Vm);  n = UInt(N:Vn);  regs = if Q == '0' then 1 else 2;
```

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<dt> Is the data type for the elements of the vectors, encoded in the "U:size" field. It can have the following values:

S8	when U = 0, size = 00
S16	when U = 0, size = 01
S32	when U = 0, size = 10
S64	when U = 0, size = 11
U8	when U = 1, size = 00
U16	when U = 1, size = 01
U32	when U = 1, size = 10
U64	when U = 1, size = 11

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            shift = SInt(Elem[D[n+r],e,esize]<7:0>);
            round_const = 1 << (-shift-1); // 0 for left shift, 2^(n-1) for right shift
            result = (Int(Elem[D[m+r],e,esize], unsigned) + round_const) << shift;
            Elem[D[d+r],e,esize] = result<esize-1:0>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

```

Notes for all encodings

Related encodings: See *Advanced SIMD one register and modified immediate* on page F3-3722 for the T32 instruction set, or *Advanced SIMD one register and modified immediate* on page F4-3807 for the A32 instruction set.

Assembler symbols

`<c>` For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<type>` Is the data type for the elements of the vectors, encoded in the "U" field. It can have the following values:

`S`	when `U = 0`
`U`	when `U = 1`

`<size>` Is the data size for the elements of the vectors, encoded in the "L:imm6<5:3>" field. It can have the following values:

`8`	when `L = 0`, `imm6<5:3> = 001`
`16`	when `L = 0`, `imm6<5:3> = 01x`
`32`	when `L = 0`, `imm6<5:3> = 1xx`
`64`	when `L = 1`, `imm6<5:3> = xxx`

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Qm>` Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

`<Dm>` Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

`<imm>` Is an immediate value, in the range 1 to `<size>`, encoded in the "imm6" field as `<size> - <imm>`.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    round_const = 1 << (shift_amount - 1);
    for r = 0 to regs-1
        for e = 0 to elements-1
            result = (Int(Elem[D[m+r],e,esize], unsigned) + round_const) >> shift_amount;
            Elem[D[d+r],e,esize] = result<esize-1:0>;

F6.1.206 VRSHR (zero)

Vector Rounding Shift Right copies the contents of one SIMD register to another

This instruction is a pseudo-instruction of the VORR (register) instruction. This means that:

- The encodings in this description are named to match the encodings of VORR (register).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VORR (register) gives the operational pseudocode for this instruction.

A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VRSHR{<c>}{<q>}.<dt> <Dd>, <Dm>, #0
```

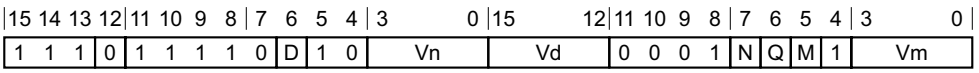
is equivalent to

```
VORR{<c>}{<q>}{.<dt>} <Dd>, <Dm>, <Dm>
```

and is never the preferred disassembly.

128-bit SIMD vector variant

Applies when `Q == 1`.



```
VRSHR{<c>}{<q>}.<dt> <Qd>, <Qm>, #0
```

is equivalent to

```
VORR{<c>}{<q>}{.<dt>} <Qd>, <Qm>, <Qm>
```

and is never the preferred disassembly.

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VRSHR{<c>}{<q>}.<dt> <Dd>, <Dm>, #0
```

is equivalent to

```
VORR{<c>}{<q>}{.<dt>} <Dd>, <Dm>, <Dm>
```

and is never the preferred disassembly.

128-bit SIMD vector variant

Applies when `Q == 1`.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

`VRSHR{<c>}{<q>}.<dt> <Qd>, <Qm>, #0`

is equivalent to

`VORR{<c>}{<q>}{.<dt>} <Qd>, <Qm>, <Qm>`

and is never the preferred disassembly.

Assembler symbols

`<c>` For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<dt>` Is the data type for the elements of the vectors, and must be one of: S8, S16, S32, S64, U8, U16, U32 or U64.

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Qm>` Is the 128-bit name of the SIMD&FP source register, encoded in the "N:Vn" and "M:Vm" field as <Qm>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

`<Dm>` Is the 64-bit name of the SIMD&FP source register, encoded in the "N:Vn" and "M:Vm" field.

Operation for all encodings

The description of VORR (register) gives the operational pseudocode for this instruction.

F6.1.207 VRSHRN

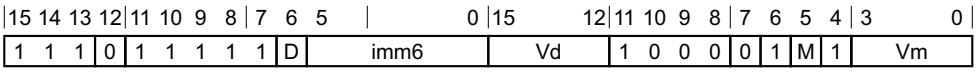
Vector Rounding Shift Right and Narrow takes each element in a vector, right shifts them by an immediate value, and places the rounded results in the destination vector. For truncated results, see VSHRN.

The operand elements can be 16-bit, 32-bit, or 64-bit integers. There is no distinction between signed and unsigned integers. The destination elements are half the size of the source elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1

A1 variant



Applies when `imm6 != 000xxx`.

```
VRSHRN{<c>}{<q>}.I<size> <Dd>, <Qm>, #<imm>
```

Decode for this encoding

```
if imm6 == '000xxx' then SEE "Related encodings";
if Vm<0> == '1' then UNDEFINED;
case imm6 of
    when '001xxx'  esize = 8;  elements = 8;  shift_amount = 16 - UInt(imm6);
    when '01xxxx'  esize = 16;  elements = 4;  shift_amount = 32 - UInt(imm6);
    when '1xxxxx'  esize = 32;  elements = 2;  shift_amount = 64 - UInt(imm6);
d = UInt(D:Vd);  m = UInt(M:Vm);
```

T1

T1 variant

Applies when `imm6 != 000xxx`.

```
VRSHRN{<c>}{<q>}.I<size> <Dd>, <Qm>, #<imm>
```

Decode for this encoding

```
if imm6 == '000xxx' then SEE "Related encodings";
if Vm<0> == '1' then UNDEFINED;
case imm6 of
    when '001xxx'  esize = 8;  elements = 8;  shift_amount = 16 - UInt(imm6);
    when '01xxxx'  esize = 16;  elements = 4;  shift_amount = 32 - UInt(imm6);
    when '1xxxxx'  esize = 32;  elements = 2;  shift_amount = 64 - UInt(imm6);
d = UInt(D:Vd);  m = UInt(M:Vm);
```

Notes for all encodings

Related encodings: See *Advanced SIMD one register and modified immediate* on page F3-3722 for the T32 instruction set, or *Advanced SIMD one register and modified immediate* on page F4-3807 for the A32 instruction set.

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<size> Is the data size for the elements of the vectors, encoded in the "imm6<5:3>" field. It can have the following values:

- 16 when imm6<5:3> = 001
- 32 when imm6<5:3> = 01x
- 64 when imm6<5:3> = 1xx

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<imm> Is an immediate value, in the range 1 to <size>/2, encoded in the "imm6" field as <size>/2 - <imm>.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    round_const = 1 << (shift_amount-1);
    for e = 0 to elements-1
        result = LSR(Elem[Qin[m>>1],e,2*esize] + round_const, shift_amount);
        Elem[D[d],e,esize] = result<esize-1:0>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

F6.1.208 VRSHRN (zero)

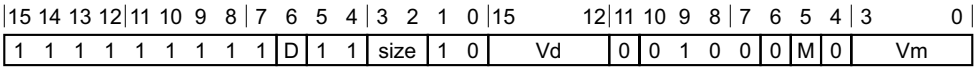
Vector Rounding Shift Right and Narrow takes each element in a vector, right shifts them by an immediate value, and places the rounded results in the destination vector

This instruction is a pseudo-instruction of the VMOVN instruction. This means that:

- The encodings in this description are named to match the encodings of VMOVN.
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VMOVN gives the operational pseudocode for this instruction.

A1

A1 variant



```
VRSHRN{<c>}{<q>}.<dt> <Dd>, <Qm>, #0
```

is equivalent to

```
VMOVN{<c>}{<q>}.<dt> <Dd>, <Qm>
```

and is never the preferred disassembly.

T1

T1 variant

```
VRSHRN{<c>}{<q>}.<dt> <Dd>, <Qm>, #0
```

is equivalent to

```
VMOVN{<c>}{<q>}.<dt> <Dd>, <Qm>
```

and is never the preferred disassembly.

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<dt> Is the data type for the elements of the operand, encoded in the "size" field. It can have the following values:

I16 when `size = 00`

I32 when `size = 01`

I64 when `size = 10`

The encoding `size = 11` is reserved.

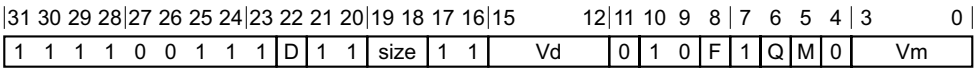
F6.1.209 VRSQRTE



Vector Reciprocal Square Root Estimate finds an approximate reciprocal square root of each element in a vector, and places the results in a second vector.

The operand and result elements are the same type, and can be floating-point numbers or unsigned integers.

For details of the operation performed by this instruction see *Floating-point reciprocal estimate and step* on page E1-3556.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

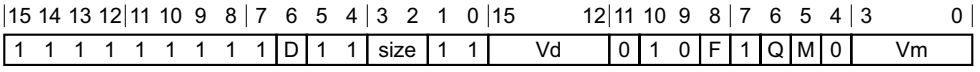
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VRSQRTE{<c>}{<q>}.<dt> <Dd>, <Dm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VRSQRTE{<c>}{<q>}.<dt> <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
if (size == '01' && !HaveFP16Ext()) || size IN {'00', '11'} then UNDEFINED;
floating_point = (F == '1');
case size of
    when '01' esize = 16; elements = 4;
    when '10' esize = 32; elements = 2;
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VRSQRTE{<c>}{<q>}.<dt> <Dd>, <Dm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VRSQRTE{<c>}{<q>}.<dt> <Qd>, <Qm>
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
if (size == '01' && !HaveFP16Ext()) || size IN {'00', '11'} then UNDEFINED;
if size == '01' && InITBlock()  then UNPREDICTABLE;
floating_point = (F == '1');
case size of
    when '01' esize = 16; elements = 4;
    when '10' esize = 32; elements = 2;
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<dt> Is the data type for the elements of the vectors, encoded in the "F:size" field. It can have the following values:

`U32` when `F = 0`, `size = 10`

`F16` when `F = 1`, `size = 01`

`F32` when `F = 1`, `size = 10`

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Newton-Raphson iteration

For details of the operation performed and how it can be used in a Newton-Raphson iteration to calculate the reciprocal of the square root of a number, see *Floating-point reciprocal estimate and step* on page E1-3556.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            if floating_point then
                Elem[D[d+r],e,esize] = FPRSqrtEstimate(Elem[D[m+r],e,esize], StandardFPSCRValue());
            else
                Elem[D[d+r],e,esize] = UnsignedRSqrtEstimate(Elem[D[m+r],e,esize]);
```

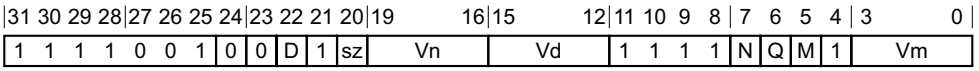
F6.1.210 VRSQRTS



Vector Reciprocal Square Root Step multiplies the elements of one vector by the corresponding elements of another vector, subtracts each of the products from 3.0, divides these results by 2.0, and places the results into the elements of the destination vector.

The operand and result elements are floating-point numbers.

For details of the operation performed by this instruction see *Floating-point reciprocal estimate and step* on page E1-3556.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

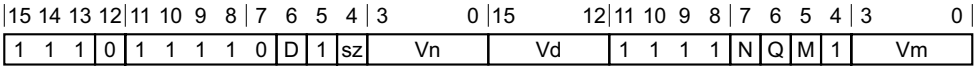
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VRSQRTS{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VRSQRTS{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
case sz of
    when '0' esize = 32; elements = 2;
    when '1' esize = 16; elements = 4;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

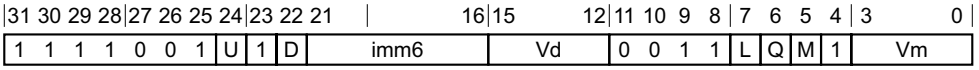
F6.1.211 VRSRA



Vector Rounding Shift Right and Accumulate takes each element in a vector, right shifts them by an immediate value, and accumulates the rounded results into the destination vector.For truncated results, see VSRA.

The operand and result elements must all be the same type, and can be any one of:

- 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
- 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

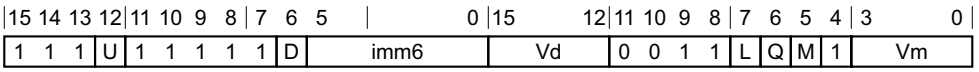
A1

64-bit SIMD vector variant

Applies when `!(imm6 == 000xxx && L == 0) && Q == 0`.

```
VRSRA{<c>}{<q>}.<type><size> {<Dd>,} <Dm>, #<imm>
```

128-bit SIMD vector variant



Applies when `!(imm6 == 000xxx && L == 0) && Q == 1`.

```
VRSRA{<c>}{<q>}.<type><size> {<Qd>,} <Qm>, #<imm>
```

Decode for all variants of this encoding

```
if (L:imm6) == '0000xxx' then SEE "Related encodings";
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
case L:imm6 of
    when '0001xxx'  esize = 8;  elements = 8;  shift_amount = 16 - UInt(imm6);

```

Notes for all encodings

Related encodings: See *Advanced SIMD one register and modified immediate* on page F3-3722 for the T32 instruction set, or *Advanced SIMD one register and modified immediate* on page F4-3807 for the A32 instruction set.

Assembler symbols

`<c>` For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<type>` Is the data type for the elements of the vectors, encoded in the "U" field. It can have the following values:

`S`	when `U = 0`
`U`	when `U = 1`

`<size>` Is the data size for the elements of the vectors, encoded in the "L:imm6<5:3>" field. It can have the following values:

`8`	when `L = 0`, `imm6<5:3> = 001`
`16`	when `L = 0`, `imm6<5:3> = 01x`
`32`	when `L = 0`, `imm6<5:3> = 1xx`
`64`	when `L = 1`, `imm6<5:3> = xxx`

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Qm>` Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

`<Dm>` Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

`<imm>` Is an immediate value, in the range 1 to `<size>`, encoded in the "imm6" field as `<size> - <imm>`.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    round_const = 1 << (shift_amount - 1);
    for r = 0 to regs-1
        for e = 0 to elements-1
            result = (Int(Elem[D[m+r],e,esize], unsigned) + round_const) >> shift_amount;
            Elem[D[d+r],e,esize] = Elem[D[d+r],e,esize] + result;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

F6.1.212 VRSUBHN

Vector Rounding Subtract and Narrow, returning High Half subtracts the elements of one quadword vector from the corresponding elements of another quadword vector, takes the most significant half of each result, and places the final results in a doubleword vector. The results are rounded. For truncated results, see VSUBHN.

The operand elements can be 16-bit, 32-bit, or 64-bit integers. There is no distinction between signed and unsigned integers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

VSELVS.F16 <Sd>, <Sn>, <Sm> // Not permitted in IT block
```

VSELVS,singleprec variant

Applies when cc == 01 && size == 10.

```
VSELVS.F32 <Sd>, <Sn>, <Sm> // Not permitted in IT block
```

Decode for all variants of this encoding

```
if InITBlock() then UNPREDICTABLE;
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
case size of
    when '01' esize = 16; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
    when '10' esize = 32; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
    when '11' esize = 64; d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
cond = cc:(cc<1> EOR cc<0>):'0';
```

CONSTRAINED UNPREDICTABLE behavior

If `InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dn>	Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

<Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.

<Sn> Is the 32-bit name of the first SIMD&FP source register, encoded in the "Vn:N" field.

<Sm> Is the 32-bit name of the second SIMD&FP source register, encoded in the "Vm:M" field.

Operation for all encodings

```
EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
case esize of
    when 16
        S[d] = Zeros(16) : (if ConditionHolds(cond) then S[n] else S[m])<15:0>;
    when 32
        S[d] = if ConditionHolds(cond) then S[n] else S[m];
    when 64
        D[d] = if ConditionHolds(cond) then D[n] else D[m];
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

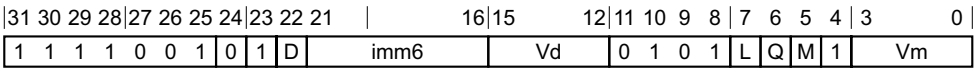
F6.1.216 VSHL (immediate)



Vector Shift Left (immediate) takes each element in a vector of integers, left shifts them by an immediate value, and places the results in the destination vector.

Bits shifted out of the left of each element are lost.

The elements must all be the same size, and can be 8-bit, 16-bit, 32-bit, or 64-bit integers. There is no distinction between signed and unsigned integers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

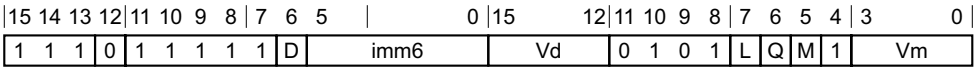
A1

64-bit SIMD vector variant

Applies when `!(imm6 == 000xxx && L == 0) && Q == 0`.

```
VSHL{<c>}{<q>}.I<size> {<Dd>,} <Dm>, #<imm>
```

128-bit SIMD vector variant



Applies when `!(imm6 == 000xxx && L == 0) && Q == 1`.

```
VSHL{<c>}{<q>}.I<size> {<Qd>,} <Qm>, #<imm>
```

Decode for all variants of this encoding

```
if L:imm6 == '0000xxx' then SEE "Related encodings";
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
case L:imm6 of
    when '0001xxx'  esize = 8;  elements = 8;  shift_amount = UInt(imm6) - 8;
    when '001xxxx'  esize = 16;  elements = 4;  shift_amount = UInt(imm6) - 16;
    when '01xxxxx'  esize = 32;  elements = 2;  shift_amount = UInt(imm6) - 32;
    when '1xxxxxx'  esize = 64;  elements = 1;  shift_amount = UInt(imm6);
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1

64-bit SIMD vector variant

Applies when `!(imm6 == 000xxx && L == 0) && Q == 0`.

```
VSHL{<c>}{<q>}.I<size> {<Dd>,} <Dm>, #<imm>
```

128-bit SIMD vector variant

Applies when `!(imm6 == 000xxx && L == 0) && Q == 1`.

```
VSHL{<c>}{<q>}.I<size> {<Qd>,} <Qm>, #<imm>
```

Non-Confidential

Decode for all variants of this encoding

```
if L:imm6 == '0000xxx' then SEE "Related encodings";
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
case L:imm6 of
    when '0001xxx'  esize = 8;  elements = 8;  shift_amount = UInt(imm6) - 8;
    when '001xxxx'  esize = 16;  elements = 4;  shift_amount = UInt(imm6) - 16;
    when '01xxxxx'  esize = 32;  elements = 2;  shift_amount = UInt(imm6) - 32;
    when '1xxxxxx'  esize = 64;  elements = 1;  shift_amount = UInt(imm6);
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

Notes for all encodings

Related encodings: See *Advanced SIMD one register and modified immediate* on page F3-3722 for the T32 instruction set, or *Advanced SIMD one register and modified immediate* on page F4-3807 for the A32 instruction set.

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<size> Is the data size for the elements of the vectors, encoded in the "L:imm6<5:3>" field. It can have the following values:

- 8 when L = 0, imm6<5:3> = 001
- 16 when L = 0, imm6<5:3> = 01x
- 32 when L = 0, imm6<5:3> = 1xx
- 64 when L = 1, imm6<5:3> = xxx

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

<imm> Is an immediate value, in the range 0 to <size>-1, encoded in the "imm6" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            Elem[D[d+r],e,esize] = LSL(Elem[D[m+r],e,esize], shift_amount);
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.

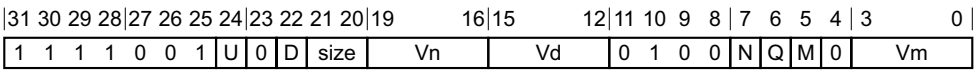
F6.1.217 VSHL (register)

Vector Shift Left (register) takes each element in a vector, shifts them by a value from the least significant byte of the corresponding element of a second vector, and places the results in the destination vector. If the shift value is positive, the operation is a left shift. If the shift value is negative, it is a truncating right shift.

For a rounding shift, see VRSHL.



The first operand and result elements are the same data type, and can be any one of:

- 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
- 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

The second operand is always a signed integer of the same size.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

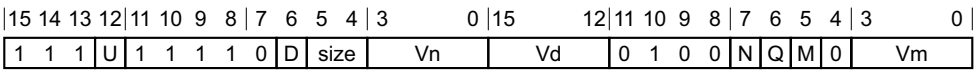
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VSHL{<c>}{<q>}.<dt> {<Dd>,} <Dm>, <Dn>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

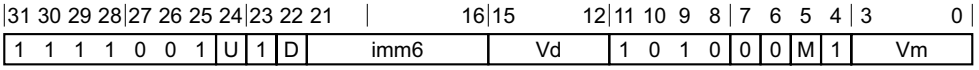
F6.1.218 VSHLL

Vector Shift Left Long takes each element in a doubleword vector, left shifts them by an immediate value, and places the results in a quadword vector.



The operand elements can be:

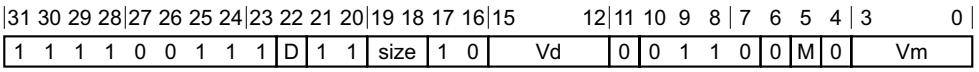
- 8-bit, 16-bit, or 32-bit signed integers.
- 8-bit, 16-bit, or 32-bit unsigned integers.
- 8-bit, 16-bit, or 32-bit untyped integers, maximum shift only.

The result elements are twice the length of the operand elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1

A1 variant



Applies when `imm6 != 000xxx`.

```
VSHLL{<c>}{<q>}.<type><size> <Qd>, <Dm>, #<imm>
```

Decode for this encoding

```
if imm6 == '000xxx' then SEE "Related encodings";
if Vd<0> == '1' then UNDEFINED;
case imm6 of
    when '001xxx'  esize = 8;  elements = 8;  shift_amount = UInt(imm6) - 8;

Non-Confidential

<size> The data size for the elements of the operand. The following table shows the permitted values and their encodings:

<size>	Encoding T1/A1	Encoding T2/A2
8	Encoded as imm6<5:3> = 0b001	Encoded as size = 0b00
16	Encoded as imm6<5:4> = 0b01	Encoded as size = 0b01
32	Encoded as imm6<5> = 1	Encoded as size = 0b10

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

<imm> The immediate value. <imm> must lie in the range 1 to <size>, and:

- If <size> == <imm>, the encoding is T2/A2.
- Otherwise, the encoding is T1/A1, and:
  - If <size> == 8, <imm> is encoded in imm6<2:0>.
  - If <size> == 16, <imm> is encoded in imm6<3:0>.
  - If <size> == 32, <imm> is encoded in imm6<4:0>.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for e = 0 to elements-1
        result = Int(Elem[Din[m],e,esize], unsigned) << shift_amount;
        Elem[Q[d>>1],e,2*esize] = result<2*esize-1:0>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

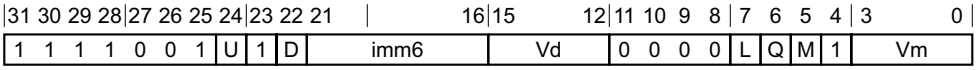
F6.1.219 VSHR



Vector Shift Right takes each element in a vector, right shifts them by an immediate value, and places the truncated results in the destination vector. For rounded results, see VRSHR.

The operand and result elements must be the same size, and can be any one of:

- 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
- 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

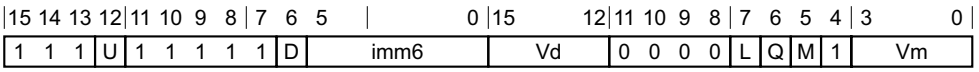
A1

64-bit SIMD vector variant

Applies when `!(imm6 == 000xxx && L == 0) && Q == 0`.

```
VSHR{<c>}{<q>}.<type><size> {<Dd>,} <Dm>, #<imm>
```

128-bit SIMD vector variant



Applies when `!(imm6 == 000xxx && L == 0) && Q == 1`.

```
VSHR{<c>}{<q>}.<type><size> {<Qd>,} <Qm>, #<imm>
```

Decode for all variants of this encoding

```
if (L:imm6) == '0000xxx' then SEE "Related encodings";
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
case L:imm6 of
    when '0001xxx'  esize = 8;  elements = 8;  shift_amount = 16 - UInt(imm6);
    when '001xxxx'  esize = 16;  elements = 4;  shift_amount = 32 - UInt(imm6);
    when '01xxxxx'  esize = 32;  elements = 2;  shift_amount = 64 - UInt(imm6);
    when '1xxxxxx'  esize = 64;  elements = 1;  shift_amount = 64 - UInt(imm6);
unsigned = (U == '1');  d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1

64-bit SIMD vector variant

Applies when `!(imm6 == 000xxx && L == 0) && Q == 0`.

```
VSHR{<c>}{<q>}.<type><size> {<Dd>,} <Dm>, #<imm>
```

128-bit SIMD vector variant

Applies when `!(imm6 == 000xxx && L == 0) && Q == 1`.

```
VSHR{<c>}{<q>}.<type><size> {<Qd>,} <Qm>, #<imm>
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Decode for all variants of this encoding

```
if (L:imm6) == '0000xxx' then SEE "Related encodings";
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
case L:imm6 of
    when '0001xxx'  esize = 8;  elements = 8;  shift_amount = 16 - UInt(imm6);

    when '1xxxxxx'  esize = 64;  elements = 1;  shift_amount = 64 - UInt(imm6);
unsigned = (U == '1');  d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

Notes for all encodings

Related encodings: See *Advanced SIMD one register and modified immediate* on page F3-3722 for the T32 instruction set, or *Advanced SIMD one register and modified immediate* on page F4-3807 for the A32 instruction set.

Assembler symbols

`<c>` For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<type>` Is the data type for the elements of the vectors, encoded in the "U" field. It can have the following values:

`S`	when `U = 0`
`U`	when `U = 1`

`<size>` Is the data size for the elements of the vectors, encoded in the "L:imm6<5:3>" field. It can have the following values:

`8`	when `L = 0`, `imm6<5:3> = 001`
`16`	when `L = 0`, `imm6<5:3> = 01x`
`32`	when `L = 0`, `imm6<5:3> = 1xx`
`64`	when `L = 1`, `imm6<5:3> = xxx`

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Qm>` Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

`<Dm>` Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

`<imm>` Is an immediate value, in the range 1 to `<size>`, encoded in the "imm6" field as `<size> - <imm>`.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            result = Int(Elem[D[m+r],e,esize], unsigned) >> shift_amount;
            Elem[D[d+r],e,esize] = result<esize-1:0>;
```

F6.1.220 VSHR (zero)

Vector Shift Right copies the contents of one SIMD register to another

This instruction is a pseudo-instruction of the VORR (register) instruction. This means that:

- The encodings in this description are named to match the encodings of VORR (register).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VORR (register) gives the operational pseudocode for this instruction.

A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VSHR{<c>}{<q>}.<dt> <Dd>, <Dm>, #0
```

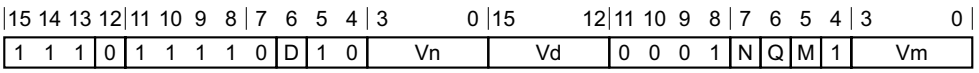
is equivalent to

```
VORR{<c>}{<q>}{.<dt>} <Dd>, <Dm>, <Dm>
```

and is never the preferred disassembly.

128-bit SIMD vector variant

Applies when `Q == 1`.



```
VSHR{<c>}{<q>}.<dt> <Qd>, <Qm>, #0
```

is equivalent to

```
VORR{<c>}{<q>}{.<dt>} <Qd>, <Qm>, <Qm>
```

and is never the preferred disassembly.

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VSHR{<c>}{<q>}.<dt> <Dd>, <Dm>, #0
```

is equivalent to

```
VORR{<c>}{<q>}{.<dt>} <Dd>, <Dm>, <Dm>
```

and is never the preferred disassembly.

128-bit SIMD vector variant

Applies when `Q == 1`.

F6.1.221 VSHRN

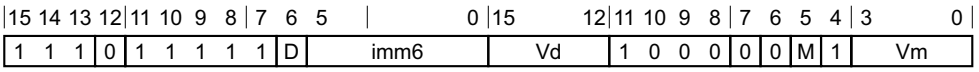
Vector Shift Right Narrow takes each element in a vector, right shifts them by an immediate value, and places the truncated results in the destination vector. For rounded results, see VRSHRN.

The operand elements can be 16-bit, 32-bit, or 64-bit integers. There is no distinction between signed and unsigned integers. The destination elements are half the size of the source elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1

A1 variant



Applies when `imm6 != 000xxx`.

```
VSHRN{<c>}{<q>}.I<size> <Dd>, <Qm>, #<imm>
```

Decode for this encoding

```
if imm6 == '000xxx' then SEE "Related encodings";
if Vm<0> == '1' then UNDEFINED;
case imm6 of
    when '001xxx'  esize = 8;  elements = 8;  shift_amount = 16 - UInt(imm6);
    when '01xxxx'  esize = 16;  elements = 4;  shift_amount = 32 - UInt(imm6);
    when '1xxxxx'  esize = 32;  elements = 2;  shift_amount = 64 - UInt(imm6);
d = UInt(D:Vd);  m = UInt(M:Vm);
```

T1

T1 variant

Applies when `imm6 != 000xxx`.

```
VSHRN{<c>}{<q>}.I<size> <Dd>, <Qm>, #<imm>
```

Decode for this encoding

```
if imm6 == '000xxx' then SEE "Related encodings";
if Vm<0> == '1' then UNDEFINED;
case imm6 of
    when '001xxx'  esize = 8;  elements = 8;  shift_amount = 16 - UInt(imm6);
    when '01xxxx'  esize = 16;  elements = 4;  shift_amount = 32 - UInt(imm6);
    when '1xxxxx'  esize = 32;  elements = 2;  shift_amount = 64 - UInt(imm6);
d = UInt(D:Vd);  m = UInt(M:Vm);
```

Notes for all encodings

Related encodings: See *Advanced SIMD one register and modified immediate* on page F3-3722 for the T32 instruction set, or *Advanced SIMD one register and modified immediate* on page F4-3807 for the A32 instruction set.

F6.1.222 VSHRN (zero)

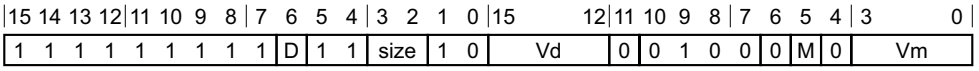
Vector Shift Right Narrow takes each element in a vector, right shifts them by an immediate value, and places the truncated results in the destination vector

This instruction is a pseudo-instruction of the VMOVN instruction. This means that:

- The encodings in this description are named to match the encodings of VMOVN.
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VMOVN gives the operational pseudocode for this instruction.

A1

A1 variant



```
VSHRN{<c>}{<q>}.<dt> <Dd>, <Qm>, #0
```

is equivalent to

```
VMOVN{<c>}{<q>}.<dt> <Dd>, <Qm>
```

and is never the preferred disassembly.

T1

T1 variant

```
VSHRN{<c>}{<q>}.<dt> <Dd>, <Qm>, #0
```

is equivalent to

```
VMOVN{<c>}{<q>}.<dt> <Dd>, <Qm>
```

and is never the preferred disassembly.

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<dt> Is the data type for the elements of the operand, encoded in the "size" field. It can have the following values:

`I16` when `size = 00`

`I32` when `size = 01`

`I64` when `size = 10`

The encoding `size = 11` is reserved.

F6.1.223 VSLI

Vector Shift Left and Insert takes each element in the operand vector, left shifts them by an immediate value, and inserts the results in the destination vector. Bits shifted out of the left of each element are lost.

The elements must all be the same size, and can be 8-bit, 16-bit, 32-bit, or 64-bit. There is no distinction between data types.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

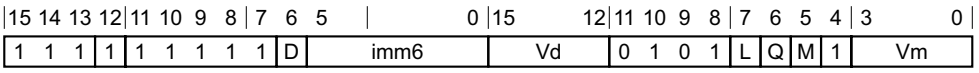
A1

64-bit SIMD vector variant

Applies when `!(imm6 == 000xxx && L == 0) && Q == 0`.

```
VSLI{<c>}{<q>}.<size> {<Dd>,} <Dm>, #<imm>
```

128-bit SIMD vector variant



Applies when `!(imm6 == 000xxx && L == 0) && Q == 1`.

```
VSLI{<c>}{<q>}.<size> {<Qd>,} <Qm>, #<imm>
```

Decode for all variants of this encoding

```
if (L:imm6) == '0000xxx' then SEE "Related encodings";
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
case L:imm6 of
    when '0001xxx'  esize = 8;  elements = 8;  shift_amount = UInt(imm6) - 8;
    when '001xxxx'  esize = 16;  elements = 4;  shift_amount = UInt(imm6) - 16;
    when '01xxxxx'  esize = 32;  elements = 2;  shift_amount = UInt(imm6) - 32;
    when '1xxxxxx'  esize = 64;  elements = 1;  shift_amount = UInt(imm6);
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1

```

Notes for all encodings

Related encodings: See *Advanced SIMD one register and modified immediate* on page F3-3722 for the T32 instruction set, or *Advanced SIMD one register and modified immediate* on page F4-3807 for the A32 instruction set.

Assembler symbols

`<c>` For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<size>` Is the data size for the elements of the vectors, encoded in the "L:imm6<5:3>" field. It can have the following values:

8	when `L = 0`, `imm6<5:3> = 001`
16	when `L = 0`, `imm6<5:3> = 01x`
32	when `L = 0`, `imm6<5:3> = 1xx`
64	when `L = 1`, `imm6<5:3> = xxx`

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Qm>` Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

`<Dm>` Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

`<imm>` Is an immediate value, in the range 0 to `<size>`-1, encoded in the "imm6" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    mask = LSL(Ones(esize), shift_amount);
    for r = 0 to regs-1
        for e = 0 to elements-1
            shifted_op = LSL(Elem[D[m+r],e,esize], shift_amount);
            Elem[D[d+r],e,esize] = (Elem[D[d+r],e,esize] AND NOT(mask)) OR shifted_op;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

F6.1.224 VSQRT

Square Root calculates the square root of the value in a floating-point register and writes the result to another floating-point register.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1

Half-precision scalar variant

Applies when `size == 01`.

```
VSQRT{<c>}{<q>}.F16 <Sd>, <Sm>
```

Single-precision scalar variant

Applies when `size == 10`.

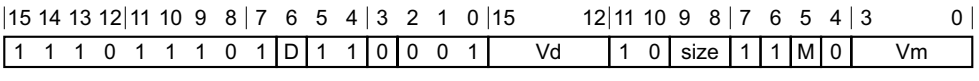
```
VSQRT{<c>}{<q>}.F32 <Sd>, <Sm>
```

Double-precision scalar variant

Applies when `size == 11`.

```
VSQRT{<c>}{<q>}.F64 <Dd>, <Dm>
```

Decode for all variants of this encoding



```
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
if size == '01' && cond != '1110' then UNPREDICTABLE;
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
case size of
    when '01' esize = 16; d = UInt(Vd:D); m = UInt(Vm:M);
    when '10' esize = 32; d = UInt(Vd:D); m = UInt(Vm:M);
    when '11' esize = 64; d = UInt(D:Vd); m = UInt(M:Vm);
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && cond != '1110'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

T1

Half-precision scalar variant

Applies when `size == 01`.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

```
VSQRT{<c>}{<q>}.F16 <Sd>, <Sm>
```

Single-precision scalar variant

Applies when `size == 10`.

```
VSQRT{<c>}{<q>}.F32 <Sd>, <Sm>
```

Double-precision scalar variant

Applies when `size == 11`.

```
VSQRT{<c>}{<q>}.F64 <Dd>, <Dm>
```

Decode for all variants of this encoding

```
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
if size == '01' && InITBlock()  then UNPREDICTABLE;
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
case size of
    when '01' esize = 16; d = UInt(Vd:D); m = UInt(Vm:M);
    when '10' esize = 32; d = UInt(Vd:D); m = UInt(Vm:M);
    when '11' esize = 64; d = UInt(D:Vd); m = UInt(M:Vm);
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

`<c>`	See *Standard assembler syntax fields* on page F2-3660.
`<q>`	See *Standard assembler syntax fields* on page F2-3660.
`<Sd>`	Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.
`<Sm>`	Is the 32-bit name of the SIMD&FP source register, encoded in the "Vm:M" field.
`<Dd>`	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
`<Dm>`	Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckVFPEnabled(TRUE);
    case esize of
        when 16 S[d] = Zeros(16) : FPSqrt(S[m]<15:0>, FPSCR);
        when 32 S[d] = FPSqrt(S[m], FPSCR);
        when 64 D[d] = FPSqrt(D[m], FPSCR);
```

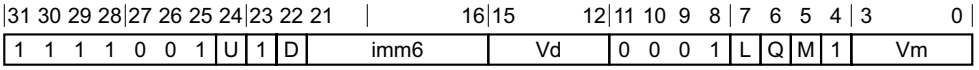
F6.1.225 VSRA



Vector Shift Right and Accumulate takes each element in a vector, right shifts them by an immediate value, and accumulates the truncated results into the destination vector. For rounded results, see VRSRA.

The operand and result elements must all be the same type, and can be any one of:

- 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
- 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

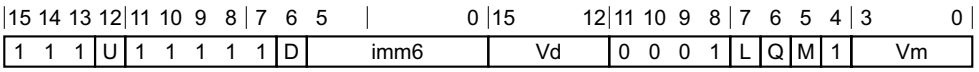
A1

64-bit SIMD vector variant

Applies when `!(imm6 == 000xxx && L == 0) && Q == 0`.

```
VSRA{<c>}{<q>}.<type><size> {<Dd>,} <Dm>, #<imm>
```

128-bit SIMD vector variant



Applies when `!(imm6 == 000xxx && L == 0) && Q == 1`.

```
VSRA{<c>}{<q>}.<type><size> {<Qd>,} <Qm>, #<imm>
```

Decode for all variants of this encoding

```
if (L:imm6) == '0000xxx' then SEE "Related encodings";
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
case L:imm6 of
    when '0001xxx'  esize = 8;  elements = 8;  shift_amount = 16 - UInt(imm6);
    when '001xxxx'  esize = 16;  elements = 4;  shift_amount = 32 - UInt(imm6);
    when '01xxxxx'  esize = 32;  elements = 2;  shift_amount = 64 - UInt(imm6);
    when '1xxxxxx'  esize = 64;  elements = 1;  shift_amount = 64 - UInt(imm6);
unsigned = (U == '1');  d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1

64-bit SIMD vector variant

Applies when `!(imm6 == 000xxx && L == 0) && Q == 0`.

```
VSRA{<c>}{<q>}.<type><size> {<Dd>,} <Dm>, #<imm>
```

128-bit SIMD vector variant

Applies when `!(imm6 == 000xxx && L == 0) && Q == 1`.

```
VSRA{<c>}{<q>}.<type><size> {<Qd>,} <Qm>, #<imm>
```

Notes for all encodings

Related encodings: See *Advanced SIMD one register and modified immediate* on page F3-3722 for the T32 instruction set, or *Advanced SIMD one register and modified immediate* on page F4-3807 for the A32 instruction set.

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<type> Is the data type for the elements of the vectors, encoded in the "U" field. It can have the following values:

S	when U = 0
U	when U = 1

<size> Is the data size for the elements of the vectors, encoded in the "L:imm6<5:3>" field. It can have the following values:

8	when L = 0, imm6<5:3> = 001
16	when L = 0, imm6<5:3> = 01x
32	when L = 0, imm6<5:3> = 1xx
64	when L = 1, imm6<5:3> = xxx

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

<imm> Is an immediate value, in the range 1 to <size>, encoded in the "imm6" field as <size> - <imm>.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            result = Int(Elem[D[m+r],e,esize], unsigned) >> shift_amount;
            Elem[D[d+r],e,esize] = Elem[D[d+r],e,esize] + result;
```

F6.1.226 VSRI

Vector Shift Right and Insert takes each element in the operand vector, right shifts them by an immediate value, and inserts the results in the destination vector. Bits shifted out of the right of each element are lost.

The elements must all be the same size, and can be 8-bit, 16-bit, 32-bit, or 64-bit. There is no distinction between data types.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

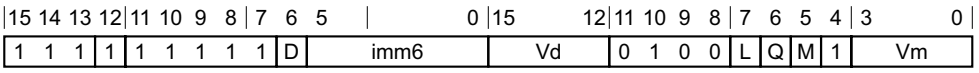
A1

64-bit SIMD vector variant

Applies when `!(imm6 == 000xxx && L == 0) && Q == 0`.

```
VSRI{<c>}{<q>}.<size> {<Dd>,} <Dm>, #<imm>
```

128-bit SIMD vector variant



Applies when `!(imm6 == 000xxx && L == 0) && Q == 1`.

```
VSRI{<c>}{<q>}.<size> {<Qd>,} <Qm>, #<imm>
```

Decode for all variants of this encoding

```
if (L:imm6) == '0000xxx' then SEE "Related encodings";
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;

if n == 15 then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> For encoding A1, A2 and A3: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1, T2 and T3: see *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<size> Is the data size, encoded in the "size" field. It can have the following values:

- 8 when size = 00
- 16 when size = 01
- 32 when size = 10

<list> Is a list containing the single 64-bit name of the SIMD&FP register holding the element.

The list must be { <Dd>[<index>] }.

The register <Dd> is encoded in the "D:Vd" field.

The permitted values and encoding of <index> depend on <size>:

<size> == 8<index> is in the range 0 to 7, encoded in the "index_align<3:1>" field.

<size> == 16<index> is in the range 0 to 3, encoded in the "index_align<3:2>" field.

<size> == 32<index> is 0 or 1, encoded in the "index_align<3>" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

<align> When <size> == 8, <align> must be omitted, otherwise it is the optional alignment.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Whenever <align> is omitted, the standard alignment is used, see *Unaligned data access* on page E2-3586, and the encoding depends on <size>:

<size> == 8 Encoded in the "index_align<0>" field as 0.

<size> == 16 Encoded in the "index_align<1:0>" field as 0b00.

<size> == 32 Encoded in the "index_align<2:0>" field as 0b000.

Whenever <align> is present, the permitted values and encoding depend on <size>:

<size> == 16 <align> is 16, meaning 16-bit alignment, encoded in the "index_align<1:0>" field as 0b01.

<size> == 32 <align> is 32, meaning 32-bit alignment, encoded in the "index_align<2:0>" field as 0b011.

: is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see *The Advanced SIMD addressing mode* on page F2-3681.

<Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see *The Advanced SIMD addressing mode* on page F2-3681.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    address = R[n];  iswrite = TRUE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    MemU[address,ebytes] = Elem[D[d],index];
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + ebytes;
```

F6.1.228 VST1 (multiple single elements)

Store multiple single elements from one, two, three, or four registers stores elements to memory from one, two, three, or four registers, without interleaving. Every element of each register is stored. For details of the addressing mode see *The Advanced SIMD addressing mode* on page F2-3681.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1

Offset variant

Applies when `Rm == 1111`.

```
VST1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]
```

Post-indexed variant

Applies when `Rm == 1101`.

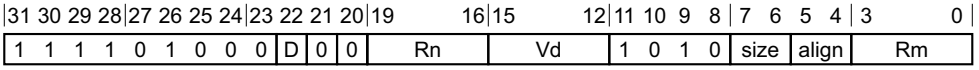
```
VST1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!
```

Post-indexed variant

Applies when `Rm != 11x1`.

```
VST1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>
```

Decode for all variants of this encoding



```
regs = 1;  if align<1> == '1' then UNDEFINED;
alignment = if align == '00' then 1 else 4 << UInt(align);
ebytes = 1 << UInt(size);  elements = 8 DIV ebytes;
d = UInt(D:Vd);  n = UInt(Rn);  m = UInt(Rm);
wback = (m != 15);  register_index = (m != 15 && m != 13);
if n == 15 || d+regs > 32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `d+regs > 32`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

wback = (m != 15);  register_index = (m != 15 && m != 13);
if n == 15 || d+regs > 32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `d+regs > 32`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

A3

Offset variant

Related encodings: See *Advanced SIMD element or structure load/store* on page F3-3736 for the T32 instruction set, or *Advanced SIMD element or structure load/store* on page F4-3811 for the A32 instruction set.

Assembler symbols

`<c>` For encoding A1, A2, A3 and A4: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1, T2, T3 and T4: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<size>` Is the data size, encoded in the "size" field. It can have the following values:

`8` when `size = 00`

`16` when `size = 01`

`32` when `size = 10`

`64` when `size = 11`

`<list>` Is a list containing the 64-bit names of the SIMD&FP registers.

The list must be one of:

`{ <Dd> }` Single register. Selects the A1 and T1 encodings of the instruction.

`{ <Dd>, <Dd+1> }` Two single-spaced registers. Selects the A2 and T2 encodings of the instruction.

`{ <Dd>, <Dd+1>, <Dd+2> }` Three single-spaced registers. Selects the A3 and T3 encodings of the instruction.

`{ <Dd>, <Dd+1>, <Dd+2>, <Dd+3> }` Four single-spaced registers. Selects the A4 and T4 encodings of the instruction.

The register `<Dd>` is encoded in the "D:Vd" field.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

`<align>` Is the optional alignment.

Whenever `<align>` is omitted, the standard alignment is used, see *Unaligned data access* on page E2-3586, and is encoded in the "align" field as `0b00`.

Whenever `<align>` is present, the permitted values are:

`64` 64-bit alignment, encoded in the "align" field as `0b01`.

`128` 128-bit alignment, encoded in the "align" field as `0b10`. Available only if `<list>` contains two or four registers.

`256` 256-bit alignment, encoded in the "align" field as `0b11`. Available only if `<list>` contains four registers.

`:` is the preferred separator before the `<align>` value, but the alignment can be specified as `@<align>`, see *The Advanced SIMD addressing mode* on page F2-3681.

`<Rm>` Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about `<Rn>`, `!`, and `<Rm>`, see *The Advanced SIMD addressing mode* on page F2-3681.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    address = R[n];  iswrite = TRUE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    for r = 0 to regs-1
        for e = 0 to elements-1
            if ebytes != 8 then
                MemU[address,ebytes] = Elem[D[d+r],e];
```

F6.1.229 VST2 (single 2-element structure from one lane)

Store single 2-element structure from one lane of two registers stores one 2-element structure to memory from corresponding elements of two registers. For details of the addressing mode see *The Advanced SIMD addressing mode* on page F2-3681.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1

Offset variant

- The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VST2 (single 2-element structure from one lane)* on page K1-7208.

Assembler symbols

`<c>` For encoding A1, A2 and A3: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1, T2 and T3: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<size>` Is the data size, encoded in the "size" field. It can have the following values:

`8` when `size = 00`

`16` when `size = 01`

`32` when `size = 10`

`<list>` Is a list containing the 64-bit names of the two SIMD&FP registers holding the element.

The list must be one of:

`{ <Dd>[<index>], <Dd+1>[<index>] }` Single-spaced registers, encoded as "spacing" = `0`.

`{ <Dd>[<index>], <Dd+2>[<index>] }` Double-spaced registers, encoded as "spacing" = 1. Not permitted when `<size>` == 8.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

The encoding of "spacing" depends on <size>:

<size> == 16"spacing" is encoded in the "index_align<1>" field.

<size> == 32"spacing" is encoded in the "index_align<2>" field.

The register <Dd> is encoded in the "D:Vd" field.

The permitted values and encoding of <index> depend on <size>:

<size> == 8<index> is in the range 0 to 7, encoded in the "index_align<3:1>" field.

<size> == 16<index> is in the range 0 to 3, encoded in the "index_align<3:2>" field.

<size> == 32<index> is 0 or 1, encoded in the "index_align<3>" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

<align> Is the optional alignment.

Whenever <align> is omitted, the standard alignment is used, see *Unaligned data access* on page E2-3586, and the encoding depends on <size>:

<size> == 8Encoded in the "index_align<0>" field as 0.

<size> == 16Encoded in the "index_align<0>" field as 0.

<size> == 32Encoded in the "index_align<1:0>" field as 0b00.

Whenever <align> is present, the permitted values and encoding depend on <size>:

<size> == 8<align> is 16, meaning 16-bit alignment, encoded in the "index_align<0>" field as 1.

<size> == 16<align> is 32, meaning 32-bit alignment, encoded in the "index_align<0>" field as 1.

<size> == 32<align> is 64, meaning 64-bit alignment, encoded in the "index_align<1:0>" field as 0b01.

: is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see *The Advanced SIMD addressing mode* on page F2-3681.

<Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see *The Advanced SIMD addressing mode* on page F2-3681.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    address = R[n];  iswrite = TRUE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);

F6.1.230 VST2 (multiple 2-element structures)

Store multiple 2-element structures from two or four registers stores multiple 2-element structures from two or four registers to memory, with interleaving. For more information, see *Element and structure load/store instructions* on page F1-3640. Every element of each register is saved. For details of the addressing mode see *The Advanced SIMD addressing mode* on page F2-3681.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1

Offset variant

Applies when `Rm == 1111`.

```
VST2{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]
```

Post-indexed variant

Applies when `Rm == 1101`.

```
VST2{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!
```

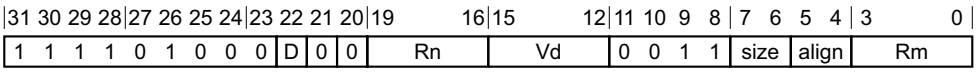
Post-indexed variant

Applies when `Rm != 11x1`.

```
VST2{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>
```

Decode for all variants of this encoding

```
regs = 1;  if align == '11' then UNDEFINED;
if size == '11' then UNDEFINED;
inc = if itype == '1001' then 2 else 1;
alignment = if align == '00' then 1 else 4 << UInt(align);
ebytes = 1 << UInt(size);  elements = 8 DIV ebytes;
d = UInt(D:Vd);  d2 = d + inc;  n = UInt(Rn);  m = UInt(Rm);
wback = (m != 15);  register_index = (m != 15 && m != 13);
if n == 15 || d2+regs > 32 then UNPREDICTABLE;
```



CONSTRAINED UNPREDICTABLE behavior

If `d2+regs > 32`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

CONSTRAINED UNPREDICTABLE behavior

If `d2+regs > 32`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VST2 (multiple 2-element structures)* on page K1-7207.

Related encodings: See *Advanced SIMD element or structure load/store* on page F3-3736 for the T32 instruction set, or *Advanced SIMD element or structure load/store* on page F4-3811 for the A32 instruction set.

Assembler symbols

`<c>` For encoding A1 and A2: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1 and T2: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<size>` Is the data size, encoded in the "size" field. It can have the following values:

`8` when `size = 00`

`16` when `size = 01`

`32` when `size = 10`

The encoding `size = 11` is reserved.

`<list>` Is a list containing the 64-bit names of the SIMD&FP registers.

The list must be one of:

`{ <Dd>, <Dd+1> }` Two single-spaced registers. Selects the A1 and T1 encodings of the instruction, and encoded in the "itype" field as `0b1000`.

`{ <Dd>, <Dd+2> }` Two double-spaced registers. Selects the A1 and T1 encodings of the instruction, and encoded in the "itype" field as `0b1001`.

`{ <Dd>, <Dd+1>, <Dd+2>, <Dd+3> }` Three single-spaced registers. Selects the A2 and T2 encodings of the instruction.

The register `<Dd>` is encoded in the "D:Vd" field.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

`<align>` Is the optional alignment.

Whenever `<align>` is omitted, the standard alignment is used, see *Unaligned data access* on page E2-3586, and is encoded in the "align" field as `0b00`.

Whenever `<align>` is present, the permitted values are:

`64` 64-bit alignment, encoded in the "align" field as `0b01`.

`128` 128-bit alignment, encoded in the "align" field as `0b10`.

`256` 256-bit alignment, encoded in the "align" field as `0b11`. Available only if `<list>` contains four registers.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

: is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see *The Advanced SIMD addressing mode* on page F2-3681.

<Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see *The Advanced SIMD addressing mode* on page F2-3681.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    address = R[n];  iswrite = TRUE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    for r = 0 to regs-1
        for e = 0 to elements-1
            MemU[address,       ebytes] = Elem[D[d+r], e];
            MemU[address+ebytes,ebytes] = Elem[D[d2+r],e];
            address = address + 2*ebytes;
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 16*regs;
```

- The instruction executes as `NOP`.
- The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VST3 (single 3-element structure from one lane)* on page K1-7208.

Assembler symbols

`<c>` For encoding A1, A2 and A3: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1, T2 and T3: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<size>` Is the data size, encoded in the "size" field. It can have the following values:

`8` when `size = 00`

`16` when `size = 01`

`32` when `size = 10`

`<list>` Is a list containing the 64-bit names of the three SIMD&FP registers holding the element.

The list must be one of:

`{ <Dd>[<index>], <Dd+1>[<index>], <Dd+2>[<index>] }` Single-spaced registers, encoded as "spacing" = `0`.

`{ <Dd>[<index>], <Dd+2>[<index>], <Dd+4>[<index>] }` Double-spaced registers, encoded as "spacing" = `1`. Not permitted when `<size>` == 8.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

The encoding of "spacing" depends on <size>:

<size> == 8"spacing" is encoded in the "index_align<0>" field.

<size> == 16"spacing" is encoded in the "index_align<1>" field, and "index_align<0>" is set to 0.

<size> == 32"spacing" is encoded in the "index_align<2>" field, and "index_align<1:0>" is set to 0b00.

The register <Dd> is encoded in the "D:Vd" field.

The permitted values and encoding of <index> depend on <size>:

<size> == 8<index> is in the range 0 to 7, encoded in the "index_align<3:1>" field.

<size> == 16<index> is in the range 0 to 3, encoded in the "index_align<3:2>" field.

<size> == 32<index> is 0 or 1, encoded in the "index_align<3>" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

<Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see *The Advanced SIMD addressing mode* on page F2-3681.

Alignment

Standard alignment rules apply, see *Alignment support* on page B2-116.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    address = R[n];
    MemU[address,         ebytes] = Elem[D[d], index];
    MemU[address+ebytes,  ebytes] = Elem[D[d2],index];
    MemU[address+2*ebytes,ebytes] = Elem[D[d3],index];
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 3*ebytes;
```

VST3{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!
```

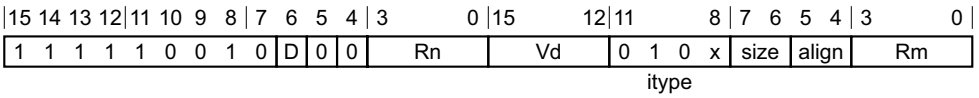
Post-indexed variant

Applies when `Rm != 11x1`.

```
VST3{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>
```

Decode for all variants of this encoding

```
if size == '11' || align<1> == '1' then UNDEFINED;
case itype of
    when '0100'
        inc = 1;
    when '0101'
        inc = 2;
    otherwise
        SEE "Related encodings";
alignment = if align<0> == '0' then 1 else 8;
ebytes = 1 << UInt(size);  elements = 8 DIV ebytes;
d = UInt(D:Vd);  d2 = d + inc;  d3 = d2 + inc;  n = UInt(Rn);  m = UInt(Rm);
wback = (m != 15);  register_index = (m != 15 && m != 13);
if n == 15 || d3 > 31 then UNPREDICTABLE;
```



CONSTRAINED UNPREDICTABLE behavior

If `d3 > 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VST3 (multiple 3-element structures)* on page K1-7208.

Related encodings: See *Advanced SIMD element or structure load/store* on page F3-3736 for the T32 instruction set, or *Advanced SIMD element or structure load/store* on page F4-3811 for the A32 instruction set.

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<size> Is the data size, encoded in the "size" field. It can have the following values:

8 when size = 00

16 when size = 01

32 when size = 10

The encoding size = 11 is reserved.

<list> Is a list containing the 64-bit names of the SIMD&FP registers.

The list must be one of:

{ <Dd>, <Dd+1>, <Dd+2> }Single-spaced registers, encoded in the "itype" field as 0b0100.

{ <Dd>, <Dd+2>, <Dd+4> }Double-spaced registers, encoded in the "itype" field as 0b0101.

The register <Dd> is encoded in the "D:Vd" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

<align> Is the optional alignment.

Whenever <align> is omitted, the standard alignment is used, see *Unaligned data access* on page E2-3586, and is encoded in the "align" field as 0b00.

Whenever <align> is present, the only permitted values is 64, meaning 64-bit alignment, encoded in the "align" field as 0b01.

: is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see *The Advanced SIMD addressing mode* on page F2-3681.

<Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see *The Advanced SIMD addressing mode* on page F2-3681.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    address = R[n];  iswrite = TRUE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    for e = 0 to elements-1
        MemU[address,         ebytes] = Elem[D[d], e];
        MemU[address+ebytes,  ebytes] = Elem[D[d2],e];
        MemU[address+2*ebytes,ebytes] = Elem[D[d3],e];
        address = address + 3*ebytes;
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 24;
```

F6.1.233 VST4 (single 4-element structure from one lane)

Store single 4-element structure from one lane of four registers stores one 4-element structure to memory from corresponding elements of four registers. For details of the addressing mode see *The Advanced SIMD addressing mode* on page F2-3681.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VST4 (single 4-element structure from one lane)* on page K1-7208.

Assembler symbols

`<c>` For encoding A1, A2 and A3: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1, T2 and T3: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<size>` Is the data size, encoded in the "size" field. It can have the following values:

`8` when `size = 00`

`16` when `size = 01`

`32` when `size = 10`

`<list>` Is a list containing the 64-bit names of the four SIMD&FP registers holding the element.

The list must be one of:

`{ <Dd>[<index>], <Dd+1>[<index>], <Dd+2>[<index>], <Dd+3>[<index>] }` Single-spaced registers, encoded as "spacing" = `0`.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

{ <Dd>[<index>], <Dd+2>[<index>], <Dd+4>[<index>], <Dd+6>[<index>] }Double-spaced registers, encoded as "spacing" = 1. Not permitted when <size> == 8.

The encoding of "spacing" depends on <size>:

<size> == 16"spacing" is encoded in the "index_align<1>" field.

<size> == 32"spacing" is encoded in the "index_align<2>" field.

The register <Dd> is encoded in the "D:Vd" field.

The permitted values and encoding of <index> depend on <size>:

<size> == 8<index> is in the range 0 to 7, encoded in the "index_align<3:1>" field.

<size> == 16<index> is in the range 0 to 3, encoded in the "index_align<3:2>" field.

<size> == 32<index> is 0 or 1, encoded in the "index_align<3>" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

<align> Is the optional alignment.

Whenever <align> is omitted, the standard alignment is used, see *Unaligned data access* on page E2-3586, and the encoding depends on <size>:

<size> == 8Encoded in the "index_align<0>" field as 0.

<size> == 16Encoded in the "index_align<0>" field as 0.

<size> == 32Encoded in the "index_align<1:0>" field as 0b00.

Whenever <align> is present, the permitted values and encoding depend on <size>:

<size> == 8<align> is 32, meaning 32-bit alignment, encoded in the "index_align<0>" field as 1.

<size> == 16<align> is 64, meaning 64-bit alignment, encoded in the "index_align<0>" field as 1.

<size> == 32<align> can be 64 or 128. 64-bit alignment is encoded in the "index_align<1:0>" field as 0b01, and 128-bit alignment is encoded in the "index_align<1:0>" field as 0b10.

: is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see *The Advanced SIMD addressing mode* on page F2-3681.

<Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see *The Advanced SIMD addressing mode* on page F2-3681.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    address = R[n];  iswrite = TRUE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    MemU[address,         ebytes] = Elem[D[d], index];
    MemU[address+ebytes,  ebytes] = Elem[D[d2],index];
    MemU[address+2*ebytes,ebytes] = Elem[D[d3],index];
    MemU[address+3*ebytes,ebytes] = Elem[D[d4],index];
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 4*ebytes;
```

F6.1.234 VST4 (multiple 4-element structures)

Store multiple 4-element structures from four registers stores multiple 4-element structures to memory from four registers, with interleaving. For more information, see *Element and structure load/store instructions* on page F1-3640. Every element of each register is saved. For details of the addressing mode see *The Advanced SIMD addressing mode* on page F2-3681.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

F6.1.235 VSTM, VSTMDB, VSTMIA

Store multiple SIMD&FP registers stores multiple registers from the Advanced SIMD and floating-point register file to consecutive memory locations using an address from a general-purpose register.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

This instruction is used by the alias VPUSH. See *Alias conditions* on page F6-5174 for details of when each alias is preferred.

A1

Decrement Before variant

Applies when `P == 1 && U == 0 && W == 1`.

```
VSTMDB{<c>}{<q>}{.<size>} <Rn>!, <dreglist>
```

Increment After variant

Applies when `P == 0 && U == 1`.

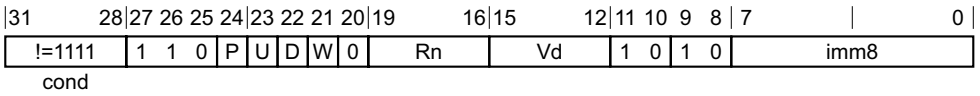
```
VSTM{<c>}{<q>}{.<size>} <Rn>{!}, <dreglist>
VSTMIA{<c>}{<q>}{.<size>} <Rn>{!}, <dreglist>
```

Decode for all variants of this encoding

```
if P == '0' && U == '0' && W == '0' then SEE "Related encodings";
if P == '1' && W == '0' then SEE "VSTR";
if P == U && W == '1' then UNDEFINED;
// Remaining combinations are PUW = 010 (IA without !), 011 (IA with !), 101 (DB with !)
single_regs = FALSE;  add = (U == '1');  wback = (W == '1');
d = UInt(D:Vd);  n = UInt(Rn);  imm32 = ZeroExtend(imm8:'00', 32);
regs = UInt(imm8) DIV 2;  // If UInt(imm8) is odd, see "FSTMX".
if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
if regs == 0 || regs > 16 || (d+regs) > 32 then UNPREDICTABLE;
if imm8<0> == '1' && (d+regs) > 16 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `regs == 0`, then one of the following behaviors must occur:



- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction operates as a `VSTM` with the same addressing mode but stores no registers.

If `regs > 16 || (d+regs) > 32`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

A2

Decrement Before variant

Applies when `P == 1 && U == 0 && W == 1`.

```
VSTMDB{<c>}{<q>}{.<size>} <Rn>!, <sreglist>
```

Increment After variant

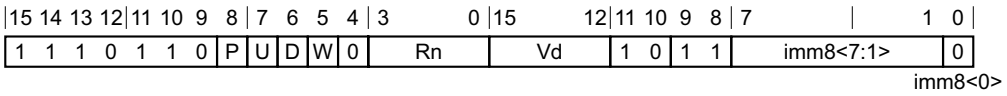
Applies when `P == 0 && U == 1`.

```
VSTM{<c>}{<q>}{.<size>} <Rn>{!}, <sreglist>
VSTMIA{<c>}{<q>}{.<size>} <Rn>{!}, <sreglist>
```

Decode for all variants of this encoding

```
if P == '0' && U == '0' && W == '0' then SEE "Related encodings";
if P == '1' && W == '0' then SEE "VSTR";
if P == U && W == '1' then UNDEFINED;
// Remaining combinations are PUW = 010 (IA without !), 011 (IA with !), 101 (DB with !)
single_regs = TRUE;  add = (U == '1');  wback = (W == '1');  d = UInt(Vd:D);  n = UInt(Rn);
imm32 = ZeroExtend(imm8:'00', 32);  regs = UInt(imm8);
if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
if regs == 0 || (d+regs) > 32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior



If `regs == 0`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction operates as a `VSTM` with the same addressing mode but stores no registers.

If `(d+regs) > 32`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VSTM* on page K1-7208.

Related encodings: See *Advanced SIMD and floating-point 64-bit move* on page F3-3723 for the T32 instruction set, or *Advanced SIMD and floating-point 64-bit move* on page F4-3794 for the A32 instruction set.

Alias conditions

Alias	is preferred when
VPUSH	`P == '1' && U == '0' && W == '1' && Rn == '1101'`

Assembler symbols

`<c>`	See *Standard assembler syntax fields* on page F2-3660.
`<q>`	See *Standard assembler syntax fields* on page F2-3660.
`<size>`	An optional data size specifier. If present, it must be equal to the size in bits, 32 or 64, of the registers being transferred.
`<Rn>`	Is the general-purpose base register, encoded in the "Rn" field. If writeback is not specified, the PC can be used. However, Arm deprecates use of the PC.
`!`	Specifies base register writeback. Encoded in the "W" field as 1 if present, otherwise 0.
`<sreglist>`	Is the list of consecutively numbered 32-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "Vd:D", and "imm8" is set to the number of registers in the list. The list must contain at least one register.
`<dreglist>`	Is the list of consecutively numbered 64-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "D:Vd", and "imm8" is set to twice the number of registers in the list. The list must contain at least one register, and must not contain more than 16 registers.

F6.1.236 VSTR

Store SIMD&FP register stores a single register from the Advanced SIMD and floating-point register file to memory, using an address from a general-purpose register, with an optional offset.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1

Half-precision scalar variant

Applies when `size == 01`.

```
VSTR{<c>}{<q>}.16 <Sd>, [<Rn>{, #{+/-}<imm>}]
```

Single-precision scalar variant

Applies when `size == 10`.

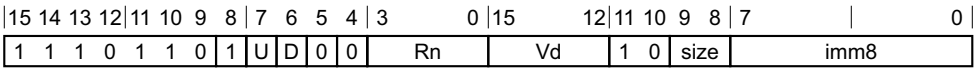
```
VSTR{<c>}{<q>}{.32} <Sd>, [<Rn>{, #{+/-}<imm>}]
```

Double-precision scalar variant

Applies when `size == 11`.

```
VSTR{<c>}{<q>}{.64} <Dd>, [<Rn>{, #{+/-}<imm>}]
```

Decode for all variants of this encoding



```
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
if size == '01' && cond != '1110' then UNPREDICTABLE;
esize = 8 << UInt(size);  add = (U == '1');
imm32 = if esize == 16 then ZeroExtend(imm8:'0', 32) else ZeroExtend(imm8:'00', 32);
case size of
    when '01' d = UInt(Vd:D);
    when '10' d = UInt(Vd:D);
    when '11' d = UInt(D:Vd);
n = UInt(Rn);
if n == 15 && CurrentInstrSet() != InstrSet_A32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && cond != '1110'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Half-precision scalar variant

Applies when size == 01.

```
VSTR{<c>}{<q>}.16 <Sd>, [<Rn>{, #{+/-}<imm>}]
```

Single-precision scalar variant

Applies when size == 10.

```
VSTR{<c>}{<q>}{.32} <Sd>, [<Rn>{, #{+/-}<imm>}]
```

Double-precision scalar variant

Applies when size == 11.

```
VSTR{<c>}{<q>}{.64} <Dd>, [<Rn>{, #{+/-}<imm>}]
```

Decode for all variants of this encoding

```
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
if size == '01' && InITBlock()  then UNPREDICTABLE;
esize = 8 << UInt(size);  add = (U == '1');
imm32 = if esize == 16 then ZeroExtend(imm8:'0', 32) else ZeroExtend(imm8:'00', 32);
case size of
    when '01' d = UInt(Vd:D);
    when '10' d = UInt(Vd:D);
    when '11' d = UInt(D:Vd);
n = UInt(Rn);
if n == 15 && CurrentInstrSet() != InstrSet_A32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If size == '01' && InITBlock(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c>	See *Standard assembler syntax fields* on page F2-3660.
<q>	See *Standard assembler syntax fields* on page F2-3660.
.64	Is an optional data size specifier for 64-bit memory accesses that can be used in the assembler source code, but is otherwise ignored.
<Dd>	Is the 64-bit name of the SIMD&FP source register, encoded in the "D:Vd" field.
.32	Is an optional data size specifier for 32-bit memory accesses that can be used in the assembler source code, but is otherwise ignored.
<Sd>	Is the 32-bit name of the SIMD&FP source register, encoded in the "Vd:D" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

+/- Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when `U = 0`

+ when `U = 1`

<imm> For the single-precision scalar or double-precision scalar variants: is the optional unsigned immediate byte offset, a multiple of 4, in the range 0 to 1020, defaulting to 0, and encoded in the "imm8" field as <imm>/4.

For the half-precision scalar variant: is the optional unsigned immediate byte offset, a multiple of 2, in the range 0 to 510, defaulting to 0, and encoded in the "imm8" field as <imm>/2.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckVFPEnabled(TRUE);
    address = if add then (R[n] + imm32) else (R[n] - imm32);
    case esize of
        when 16
            MemA[address,2] = S[d]<15:0>;
        when 32
            MemA[address,4] = S[d];
        when 64
            // Store as two word-aligned words in the correct order for current endianness.
            MemA[address,4]   = if BigEndian() then D[d]<63:32> else D[d]<31:0>;
            MemA[address+4,4] = if BigEndian() then D[d]<31:0>  else D[d]<63:32>;
```

F6.1.237 VSUB (floating-point)

Vector Subtract (floating-point) subtracts the elements of one vector from the corresponding elements of another vector, and places the results in the destination vector.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

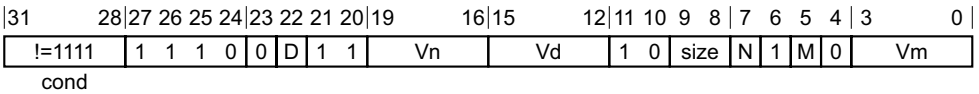
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VSUB{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VSUB{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
advsimd = TRUE;
case sz of
    when '0' esize = 32; elements = 2;
    when '1' esize = 16; elements = 4;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

A2

Half-precision scalar variant

Applies when `size == 01`.

```
VSUB{<c>}{<q>}.F16 {<Sd>,} <Sn>, <Sm>
```

Single-precision scalar variant

Applies when `size == 10`.

```
VSUB{<c>}{<q>}.F32 {<Sd>,} <Sn>, <Sm>
```

Double-precision scalar variant

Applies when `size == 11`.

```
VSUB{<c>}{<q>}.F64 {<Dd>,} <Dn>, <Dm>
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.

    when '11' esize = 64; d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

`<c>` For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding A2, T1 and T2: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<dt>` Is the data type for the elements of the vectors, encoded in the "sz" field. It can have the following values:

`F32` when `sz = 0`

`F16` when `sz = 1`

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Qn>` Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

<Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.

<Sn> Is the 32-bit name of the first SIMD&FP source register, encoded in the "Vn:N" field.

<Sm> Is the 32-bit name of the second SIMD&FP source register, encoded in the "Vm:M" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDOrVFPEnabled(TRUE, advsimd);
    if advsimd then  // Advanced SIMD instruction
        for r = 0 to regs-1
            for e = 0 to elements-1
                Elem[D[d+r],e,esize] = FPSub(Elem[D[n+r],e,esize], Elem[D[m+r],e,esize],
StandardFPSCRValue());
    else             // VFP instruction
        case esize of
            when 16
                S[d] = Zeros(16) : FPSub(S[n]<15:0>, S[m]<15:0>, FPSCR);
            when 32
                S[d] = FPSub(S[n], S[m], FPSCR);
            when 64
                D[d] = FPSub(D[n], D[m], FPSCR);
```

F6.1.238 VSUB (integer)

Vector Subtract (integer) subtracts the elements of one vector from the corresponding elements of another vector, and places the results in the destination vector.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

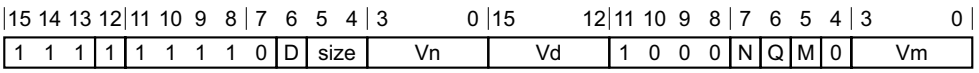
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VSUB{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VSUB{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VSUB{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VSUB{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<dt>` Is the data type for the elements of the vectors, encoded in the "size" field. It can have the following values:

`I8` when `size = 00`

`I16` when `size = 01`

`I32` when `size = 10`

`I64` when `size = 11`

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Qn>` Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

`<Qm>` Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

`<Dn>` Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

`<Dm>` Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            Elem[D[d+r],e,esize] = Elem[D[n+r],e,esize] - Elem[D[m+r],e,esize];
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

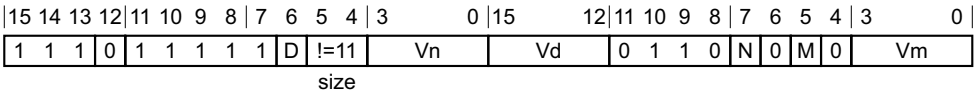
F6.1.239 VSUBHN

Vector Subtract and Narrow, returning High Half subtracts the elements of one quadword vector from the corresponding elements of another quadword vector, takes the most significant half of each result, and places the final results in a doubleword vector. The results are truncated. For rounded results, see VRSUBHN.

There is no distinction between signed and unsigned integers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1



A1 variant

```
VSUBHN{<c>}{<q>}.<dt> <Dd>, <Qn>, <Qm>
```

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
if Vn<0> == '1' || Vm<0> == '1' then UNDEFINED;
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);
```

T1

T1 variant

```
VSUBHN{<c>}{<q>}.<dt> <Dd>, <Qn>, <Qm>
```

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
if Vn<0> == '1' || Vm<0> == '1' then UNDEFINED;
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);
```

Notes for all encodings

Related encodings: See *Advanced SIMD data-processing* on page F3-3713 for the T32 instruction set, or *Advanced SIMD data-processing* on page F4-3799 for the A32 instruction set.

Assembler symbols

F6.1.242 VSWP

Vector Swap exchanges the contents of two vectors. The vectors can be either doubleword or quadword. There is no distinction between data types.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

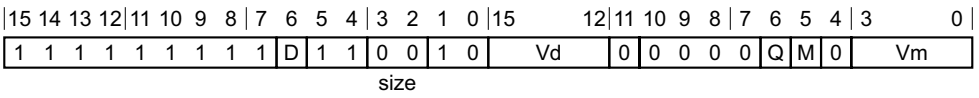
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VSWP{<c>}{<q>}{.<dt>} <Dd>, <Dm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VSWP{<c>}{<q>}{.<dt>} <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if size != '00' then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

T1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VSWP{<c>}{<q>}{.<dt>} <Dd>, <Dm>
```

128-bit SIMD vector variant

Applies when `Q == 1`.

```
VSWP{<c>}{<q>}{.<dt>} <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if size != '00' then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<dt>` An optional data type. It is ignored by assemblers, and does not affect the encoding.

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Qm>` Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

`<Dm>` Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        if d == m then
            D[d+r] = bits(64) UNKNOWN;
        else
            D[d+r] = Din[m+r];
            D[m+r] = Din[d+r];
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

F6.1.243 VTBL, VTBX

Vector Table Lookup uses byte indexes in a control vector to look up byte values in a table and generate a new vector. Indexes out of range return 0.

Vector Table Extension works in the same way, except that indexes out of range leave the destination element unchanged.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

A1

VTBL variant

Applies when `op == 0`.

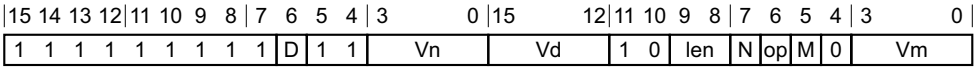
```
VTBL{<c>}{<q>}.8 <Dd>, <list>, <Dm>
```

VTBX variant

Applies when `op == 1`.

```
VTBX{<c>}{<q>}.8 <Dd>, <list>, <Dm>
```

Decode for all variants of this encoding



```
is_vtbl = (op == '0');  length = UInt(len)+1;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);
if n+length > 32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `n + length > 32`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- One or more of the SIMD and floating-point registers are UNKNOWN. This behavior does not affect any general-purpose registers.

T1

VTBL variant

Applies when `op == 0`.

```
VTBL{<c>}{<q>}.8 <Dd>, <list>, <Dm>
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

VTBX variant

Applies when op == 1.

```
VTBX{<c>}{<q>}.8 <Dd>, <list>, <Dm>
```

Decode for all variants of this encoding

```
is_vtbl = (op == '0');  length = UInt(len)+1;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);
if n+length > 32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If n + length > 32, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. This behavior does not affect any general-purpose registers.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<list> The vectors containing the table. It must be one of:

{<Dn>}	Encoded as len = 0b00.
{<Dn>, <Dn+1>}	Encoded as len = 0b01.
{<Dn>, <Dn+1>, <Dn+2>}	Encoded as len = 0b10.
{<Dn>, <Dn+1>, <Dn+2>, <Dn+3>}	Encoded as len = 0b11.

<Dm> Is the 64-bit name of the SIMD&FP source register holding the indices, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();

    // Create 256-bit = 32-byte table variable, with zeros in entries that will not be used.
    table3 = if length == 4 then D[n+3] else Zeros(64);
    table2 = if length >= 3 then D[n+2] else Zeros(64);
    table1 = if length >= 2 then D[n+1] else Zeros(64);
    table = table3 : table2 : table1 : D[n];

    for i = 0 to 7
        index = UInt(Elem[D[m],i,8]);
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

```
if index < 8*length then
    Elem[D[d],i,8] = Elem[table,index,8];
else
    if is_vtbl then
        Elem[D[d],i,8] = Zeros(8);
    // else Elem[D[d],i,8] unchanged
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

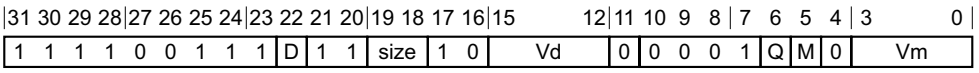
F6.1.244 VTRN

Vector Transpose treats the elements of its operand vectors as elements of 2 x 2 matrices, and transposes the matrices.

The elements of the vectors can be 8-bit, 16-bit, or 32-bit. There is no distinction between data types.



The following figure shows the operation of VTRN doubleword operations.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

This instruction is used by the pseudo-instructions VUZP (alias) and VZIP (alias). The pseudo-instruction is never the preferred disassembly.

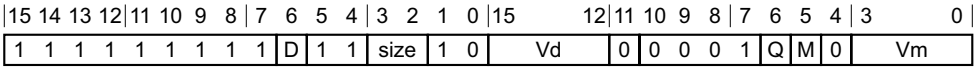
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VTRN{<c>}{<q>}.<dt> <Dd>, <Dm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```
VTRN{<c>}{<q>}.<dt> <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if size == '11' then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

```

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<dt> Is the data type for the elements of the vectors, encoded in the "size" field. It can have the following values:

8	when `size = 00`
16	when `size = 01`
32	when `size = 10`

The encoding `size = 11` is reserved.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    h = elements DIV 2;

    for r = 0 to regs-1
        if d == m then
            D[d+r] = bits(64) UNKNOWN;
        else
            for e = 0 to h-1
                Elem[D[d+r],2*e+1,esize] = Elem[Din[m+r],2*e,esize];
                Elem[D[m+r],2*e,esize] = Elem[Din[d+r],2*e+1,esize];
```

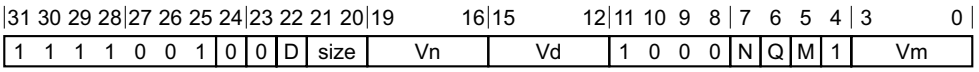
F6.1.245 VTST

Vector Test Bits takes each element in a vector, and bitwise ANDs it with the corresponding element of a second vector. If the result is not zero, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.



The operand vector elements can be any one of:

- 8-bit, 16-bit, or 32-bit fields.

The result vector elements are fields the same size as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

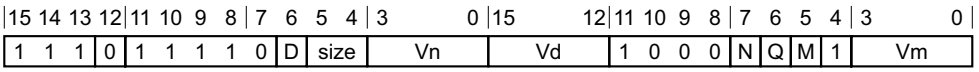
A1

64-bit SIMD vector variant

Applies when `Q == 0`.

```
VTST{<c>}{<q>}.<dt> {<Dd>,} <Dn>, <Dm>
```

128-bit SIMD vector variant



Applies when `Q == 1`.

```

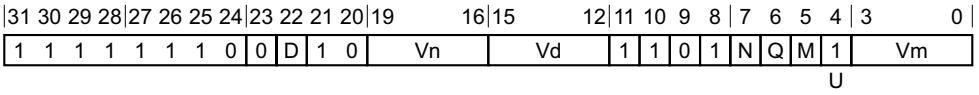
F6.1.246 VUDOT (by element)

Dot Product index form with unsigned integers. This instruction performs the dot product of the four 8-bit elements in each 32-bit element of the first source register with the four 8-bit elements of an indexed 32-bit element in the second source register, accumulating the result into the corresponding 32-bit element of the destination register.



In Armv8.2 and Armv8.3, this is an OPTIONAL instruction. From Armv8.4 it is mandatory for all implementations to support it.

Note

ID_ISAR6.DP indicates whether this instruction is supported.

A1

ARMv8.2

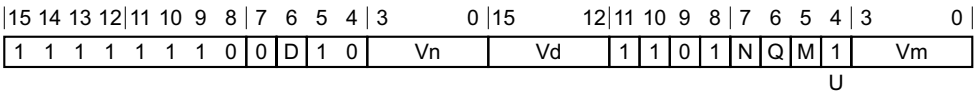
64-bit SIMD vector variant

Applies when `Q == 0`.

```
VUDOT{<q>}.U8 <Dd>, <Dn>, <Dm>[<index>]
```

128-bit SIMD vector variant

Applies when `Q == 1`.



```
VUDOT{<q>}.U8 <Qd>, <Qn>, <Dm>[<index>]
```

Decode for all variants of this encoding

```
if !HaveDOTPExt() then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1') then UNDEFINED;
boolean signed = (U=='0');
integer d = UInt(D:Vd);
integer n = UInt(N:Vn);
integer m = UInt(Vm<3:0>);
integer index = UInt(M);
integer esize = 32;
integer regs = if Q == '1' then 2 else 1;
```

F6.1.248 VUZP

Vector Unzip de-interleaves the elements of two vectors.

The elements of the vectors can be 8-bit, 16-bit, or 32-bit. There is no distinction between data types.

The following figure shows the operation of VUZP doubleword operation for data type 8.

VUZP.8, doubleword

	Register state before operation								Register state after operation							
Dd	A7	A6	A5	A4	A3	A2	A1	A0	B6	B4	B2	B0	A6	A4	A2	A0
Dm	B7	B6	B5	B4	B3	B2	B1	B0	B7	B5	B3	B1	A7	A5	A3	A1

The following figure shows the operation of VUZP quadword operation for data type 32.

VUZP.32, quadword

	Register state before operation				Register state after operation			
Qd	A3	A2	A1	A0	B2	B0	A2	A0
Qm	B3	B2	B1	B0	B3	B1	A3	A1

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

F6.1.249 VUZP (alias)

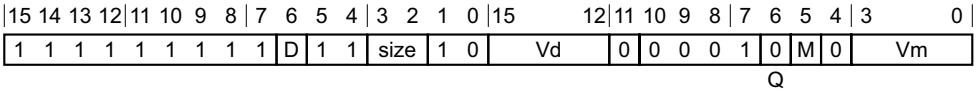
Vector Unzip de-interleaves the elements of two vectors

This instruction is a pseudo-instruction of the VTRN instruction. This means that:

- The encodings in this description are named to match the encodings of VTRN.
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VTRN gives the operational pseudocode for this instruction.

A1

64-bit SIMD vector variant



`VUZP{<c>}{<q>}.32 <Dd>, <Dm>`

is equivalent to

`VTRN{<c>}{<q>}.32 <Dd>, <Dm>`

and is never the preferred disassembly.

T1

64-bit SIMD vector variant

`VUZP{<c>}{<q>}.32 <Dd>, <Dm>`

is equivalent to

`VTRN{<c>}{<q>}.32 <Dd>, <Dm>`

and is never the preferred disassembly.

Assembler symbols

`<c>` For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

`<Dm>` Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

The description of VTRN gives the operational pseudocode for this instruction.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.

```

Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

<q> See *Standard assembler syntax fields* on page F2-3660.

<dt> For the 64-bit SIMD vector variant: is the data type for the elements of the vectors, encoded in the "size" field. It can have the following values:

- 8 when size = 00
- 16 when size = 01

The encoding size = 1x is reserved.

For the 128-bit SIMD vector variant: is the data type for the elements of the vectors, encoded in the "size" field. It can have the following values:

- 8 when size = 00
- 16 when size = 01
- 32 when size = 10

The encoding size = 11 is reserved.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    if quadword_operation then
        if d == m then
            Q[d>>1] = bits(128) UNKNOWN;  Q[m>>1] = bits(128) UNKNOWN;
        else
            bits(256) zipped_q;
            for e = 0 to (128 DIV esize) - 1
                Elem[zipped_q,2*e,esize] = Elem[Q[d>>1],e,esize];
                Elem[zipped_q,2*e+1,esize] = Elem[Q[m>>1],e,esize];
            Q[d>>1] = zipped_q<127:0>;  Q[m>>1] = zipped_q<255:128>;
    else
        if d == m then
            D[d] = bits(64) UNKNOWN;  D[m] = bits(64) UNKNOWN;
        else
            bits(128) zipped_d;
            for e = 0 to (64 DIV esize) - 1
```

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

```
        Elem[zipped_d,2*e,esize] = Elem[D[d],e,esize];
        Elem[zipped_d,2*e+1,esize] = Elem[D[m],e,esize];
    D[d] = zipped_d<63:0>;  D[m] = zipped_d<127:64>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

F6.1.251 VZIP (alias)

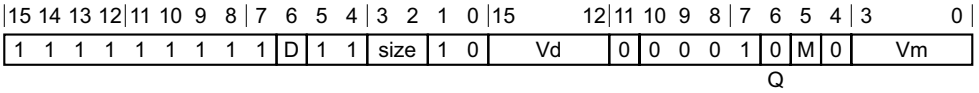
Vector Zip interleaves the elements of two vectors

This instruction is a pseudo-instruction of the VTRN instruction. This means that:

- The encodings in this description are named to match the encodings of VTRN.
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VTRN gives the operational pseudocode for this instruction.

A1

64-bit SIMD vector variant



`VZIP{<c>}{<q>}.32 <Dd>, <Dm>`

is equivalent to

`VTRN{<c>}{<q>}.32 <Dd>, <Dm>`

and is never the preferred disassembly.

T1

64-bit SIMD vector variant

`VZIP{<c>}{<q>}.32 <Dd>, <Dm>`

is equivalent to

`VTRN{<c>}{<q>}.32 <Dd>, <Dm>`

and is never the preferred disassembly.

Assembler symbols

`<c>` For encoding A1: see *Standard assembler syntax fields* on page F2-3660. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F2-3660.

`<q>` See *Standard assembler syntax fields* on page F2-3660.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

`<Dm>` Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

The description of VTRN gives the operational pseudocode for this instruction.

Part G
The AArch32 System Level Architecture

Chapter G1
The AArch32 System Level Programmers' Model

This chapter gives a system level description of the programmers' model for execution in AArch32 state. It contains the following sections:

- *About the AArch32 System level programmers' model* on page G1-5216.
- *Exception levels* on page G1-5217.
- *Exception terminology* on page G1-5218.
- *Execution state* on page G1-5220.
- *Instruction Set state* on page G1-5222.
- *Security state* on page G1-5223.
- *Security state, Exception levels, and AArch32 execution privilege* on page G1-5226.
- *Virtualization* on page G1-5228.
- *AArch32 state PE modes, and general-purpose and Special-purpose registers* on page G1-5230.
- *Process state, PSTATE* on page G1-5239.
- *Instruction set states* on page G1-5245.
- *Handling exceptions that are taken to an Exception level using AArch32* on page G1-5247.
- *Routing of aborts taken to AArch32 state* on page G1-5266.
- *Exception return to an Exception level using AArch32* on page G1-5269.
- *Asynchronous exception behavior for exceptions taken from AArch32 state* on page G1-5274.
- *AArch32 state exception descriptions* on page G1-5282.
- *Reset into AArch32 state* on page G1-5304.
- *Mechanisms for entering a low-power state* on page G1-5308.
- *The AArch32 System register interface* on page G1-5313.
- *Advanced SIMD and floating-point support* on page G1-5316.
- *Configurable instruction enables and disables, and trap controls* on page G1-5322.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

G1.1 About the AArch32 System level programmers' model

An application programmer has only a restricted view of the system. The System level programmers' model supports this application level view of the system, and includes features that are required for one or both of an operating system (OS) and a hypervisor to provide the programming environment seen by an application. This chapter describes the System level programmers' model when executing at EL1 or higher in an Exception level that is using AArch32.

The system level programmers' model includes all of the system features required to support operating systems and to handle hardware events.

The following sections give a system level introduction to the basic concepts of the ARM architecture AArch32 state, and the terminology that is used for describing the architecture when executing in this state:

- *Exception levels* on page G1-5217.
- *Exception terminology* on page G1-5218.
- *Execution state* on page G1-5220.
- *Instruction Set state* on page G1-5222.
- *Security state* on page G1-5223.
- *Virtualization* on page G1-5228.

The rest of this chapter describes the system level programmers' model when executing in AArch32 state.

The other chapters in this part describe:

- The memory system architecture, as seen when executing in an Exception level that is using AArch32:
  - Chapter G4 *The AArch32 System Level Memory Model* describes the general features of the ARMv8 memory model, when executing in AArch32 state, that are not visible at the application level.

    Note

    Chapter E2 *The AArch32 Application Level Memory Model* describes the application level view of the memory model.

  - Chapter G5 *The AArch32 Virtual Memory System Architecture* describes the *Virtual Memory System Architecture* (VMSA) used in AArch32 state.
- The AArch32 System registers, see Chapter G8 *AArch32 System Register Descriptions*.

Note

The T32 and A32 instruction sets include instructions that provide system level functionality, such as returning from an exception. See for example, *ERET* on page F5-3943.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

G1.2 Exception levels

The ARMv8-A architecture defines a set of Exception levels, EL0 to EL3, where:

- If ELn is the Exception level, increased values of *n* indicate increased software execution privilege.
- Execution at EL0 is called *unprivileged execution*.
- EL2 provides support for virtualization.
- EL3 provides support for switching between two Security states, Secure state and Non-secure state.

An implementation might not include all of the Exception levels. All implementations must include EL0 and EL1. EL2 and EL3 are optional.

Note

A PE is not required to implement a contiguous set of Exception levels. For example, it is permissible for an implementation to include only EL0, EL1, and EL3.

The effect of implementation choices on the programmers' model on page D1-2264 provides information on implementations.

When executing in AArch32 state, execution can move between Exception levels only on taking an exception or on returning from an exception:

- On taking an exception, the Exception level can only increase or remain the same.
- On returning from an exception, the Exception level can only decrease or remain the same.

The Exception level that execution changes to or remains in on taking an exception is called the *target Exception level* of the exception.

Each exception type has a target Exception level that is either:

- Implicit in the nature of the exception.
- Defined by configuration bits in the System registers.

An exception cannot target EL0.

Exception levels exist within *Security states*. *The ARMv8-A security model* on page G1-5223 describes this. When executing at an Exception level, the PE can access both of the following:

- The resources that are available for the combination of the current Exception level and the current Security state.
- The resources that are available at all lower Exception levels, provided that those resources are available to the current Security state.

This means that if the implementation includes EL3, then because EL3 is only implemented in Secure state, execution at EL3 can access all resources available at all Exception levels, for both Security states.

Each Exception level other than EL0 has its own translation regime and associated control registers. For information on the translation regimes, see Chapter G5 *The AArch32 Virtual Memory System Architecture*.

G1.2.1 Typical Exception level usage model

The architecture does not specify what software uses which Exception level. Such choices are outside the scope of the architecture. However, the following is a common usage model for the Exception levels:

EL0 Applications.

EL1 OS kernel and associated functions that are typically described as *privileged*.

EL2 Hypervisor.

EL3 Secure monitor.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

G1.3 Exception terminology

The following subsections define the terms that are used when describing exceptions:

- *Terminology for taking an exception*.
- *Terminology for returning from an exception*.
- *Exception levels*.
- *Definition of a precise exception*.
- *Definitions of synchronous and asynchronous exceptions* on page G1-5219.

G1.3.1 Terminology for taking an exception

An exception is *generated* when the PE first responds to an exceptional condition. The PE state at this time is the state that the exception is *taken from*. The PE state immediately after taking the exception is the state that the exception is *taken to*.

G1.3.2 Terminology for returning from an exception

To return from an exception, the PE must execute an exception return instruction. The PE state when an exception return instruction is committed for execution is the state the exception *returns from*. The PE state immediately after the execution of that instruction is the state that the exception *returns to*.

G1.3.3 Exception levels

An Exception level, EL*n*, with a larger value of *n* than another Exception level, is described as being a *higher* Exception level than the other Exception level. For example, EL3 is a higher Exception level than EL1.

An Exception level with a smaller value of *n* than another Exception level is described as being a *lower* Exception level than the other Exception level. For example, EL0 is a lower Exception level than EL1.

An Exception level is described as:

- *Using AArch64* when execution in that Exception level is in the AArch64 Execution state.
- *Using AArch32* when execution in that Exception level is in the AArch32 Execution state.

G1.3.4 Definition of a precise exception

An exception is described as *precise* when the exception handler receives the PE state and memory system state that is consistent with the PE having executed all of the instructions up to but not including the point in the instruction stream where the exception was taken, and none afterwards.

Other than the SError interrupt all exceptions that are taken to AArch32 state are required to be precise. For each occurrence of an SError interrupt, whether the interrupt is precise or imprecise is IMPLEMENTATION DEFINED.

Where a synchronous exception that is taken to AArch32 state is generated as part of an instruction that performs more than one single-copy atomic memory access, the definition of precise permits that the values in registers or memory affected by those instructions can be UNKNOWN, provided that:

- The accesses affecting those registers or memory locations do not, themselves, generate exceptions.
- The registers are not involved in the calculation of the memory address that is used by the instruction.

In AArch32 state, examples of instructions that perform more than one single-copy atomic memory access are the `LDM` and `STM` instructions.

Note

- For the definition of a single-copy atomic access, see *Properties of single-copy atomic accesses* on page E2-3565.
- The SError interrupt replaces the ARMv7 asynchronous abort.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

G1.3.5 Definitions of synchronous and asynchronous exceptions

An exception is described as *synchronous* if all of the following apply:

- The exception is generated as a result of direct execution or attempted execution of an instruction.
- The return address presented to the exception handler is guaranteed to indicate the instruction that caused the exception.
- The exception is precise.

An exception is described as *asynchronous* if any of the following apply:

- The exception is not generated as a result of direct execution or attempted execution of the instruction stream.
- The return address presented to the exception handler is not guaranteed to indicate the instruction that caused the exception.
- The exception is imprecise.

For more information about exceptions, see *Handling exceptions that are taken to an Exception level using AArch32* on page G1-5247.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

G1.4 Execution state

The Execution states are:

AArch64 The 64-bit Execution state.

AArch32 The 32-bit Execution state. Operation in this state is compatible with ARMv7-A operation.

Execution state on page A1-36 gives more information about them.

Exception levels *use* Execution states. For example, EL0, EL1 and EL2 might all be using AArch32, under EL3 using AArch64.

This means that:

- Different software layers, such as an application, an operating system kernel, and a hypervisor, executing at different Exception levels, can execute in different Execution states.
- The PE can change Execution states only either:
  - At reset.
  - On a change of Exception level.

Note

- *Typical Exception level usage model* on page G1-5217 shows which Exception levels different software layers might typically use.
- *The effect of implementation choices on the programmers' model* on page D1-2264 gives information on supported configurations of Exception levels and Execution states.

The interaction between the AArch64 and AArch32 Execution states is called *interprocessing*. *Interprocessing* on page D1-2251 describes this.

G1.4.1 About the AArch32 PE modes

AArch32 state provides a set of *PE modes* that support normal software execution and handle exceptions. The current mode determines the set of registers that are available, as described in *AArch32 general-purpose registers, the PC, and the Special-purpose registers* on page G1-5235.

The AArch32 modes are:

- Monitor mode. This mode always executes at Secure EL3.
- Hyp mode. This mode always executes at Non-secure EL2.
- System, Supervisor, Abort, Undefined, IRQ, and FIQ modes. The Exception level these modes execute at depends on the Security state, as described in *Security state* on page G1-5223.
- User mode. This mode always executes at EL0.

Note

AArch64 state does not support modes. Modes are a concept that is specific to AArch32 state. Modes that execute at a particular Exception level are only implemented if that Exception level supports using AArch32 state.

For more information on modes, see *AArch32 state PE mode descriptions* on page G1-5230.

The mode in use immediately before an exception is taken is described as the mode the exception is *taken from*. The mode that is used on taking the exception is described as the mode the exception is *taken to*.

All of the following define the mode that an exception is taken to:

- The type of exception.
- The mode the exception is taken from.
- Configuration settings defined at EL2 and EL3.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Monitor mode and Hyp mode can create system traps that cause exceptions to EL3 or EL2 respectively. There is an architected hierarchy where EL2 and EL3 configuration settings affect a common condition, for example interrupt routing. When no traps are enabled for a particular condition, the AArch32 mode an exception is taken to is called the *default mode* for that exception.

In AArch32 state, a number of different modes can exist at the same Exception level. All modes at a particular Exception level have the *execution privilege*, meaning they have the same access rights for accesses to memory and to System registers. However, the mapping of PE modes to Exception levels depends on the Security state, as described in *Security state* on page G1-5223. *Security state, Exception levels, and AArch32 execution privilege* on page G1-5226 gives more information about the PE modes, their associated execution privilege, and how this maps onto the Exception levels.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

G1.5 Instruction Set state

In AArch32 state, the *Instruction Set state* determines the instruction set that the PE is executing. In an implementation that follows the ARM recommendations, the available Instruction Set states are:

T32 state The PE is executing T32 instructions.

A32 state The PE is executing A32 instructions.

Note

In previous versions of the ARM architecture:

- The T32 instruction set was called the Thumb instruction set.
- The A32 instruction set was called the ARM instruction set.

For more information, see *Process state, PSTATE* on page E1-3541.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

G1.6 Security state

The ARMv8-A architecture provides two Security states, each with an associated physical memory address space, as follows:

Secure state When in this state, the PE can access both the Secure physical address space and the Non-secure physical address space.

Non-secure state When in this state, the PE:
- Can access only the Non-secure physical address space.
- Cannot access the Secure system control resources.

For information on how virtual addresses translate onto Secure physical and Non-secure addresses, see *About VMSAv8-32* on page G5-5464.

G1.6.1 The ARMv8-A security model

The principles of the ARMv8-A security model are defined in *The ARMv8-A security model* on page D1-2138.

The AArch32 security model, and execution privilege

The Exception level hierarchy of four Exception levels, EL0, EL1, EL2, and EL3, applies to execution in both Execution states. This section describes the mapping between Exception levels, AArch32 modes, and execution privilege.

The AArch32 modes Monitor, System, Supervisor, Abort, Undefined, IRQ, and FIQ all have the same execution privilege.

In Secure state:

- Monitor mode executes only at EL3, and is accessible only when EL3 is using AArch32.
- System mode, Supervisor mode, Abort mode, Undefined mode, IRQ mode, and FIQ mode all:
  - Execute at EL1 when EL3 is using AArch64.
  - Execute at EL3 when EL3 is using AArch32.

This means that there is a difference in the Secure state hierarchy that the PE is using, depending on which Execution state EL3 is using:

- If EL3 is using AArch64:
  - There is no support for Monitor mode.
  - If EL1 is using AArch32, System mode, Supervisor mode, Abort mode, Undefined mode, IRQ mode, and FIQ mode execute at Secure EL1.
- If EL3 is using AArch32:
  - Monitor mode is supported, and executes at Secure EL3.
  - System mode, Supervisor mode, Abort mode, Undefined mode, IRQ mode, and FIQ mode execute at Secure EL3.
  - There is no support for a Secure EL1 Exception level.

See *Security behavior in Exception levels using AArch32 when EL2 or EL3 are using AArch64* on page G1-5258 for more information about operation in a Secure EL1 mode when EL3 is using AArch64.

In Non-secure state, the PL1 modes System, Supervisor, Abort, Undefined, IRQ, and FIQ always execute at EL1.

User mode always executes at EL0 and has the lowest possible execution privilege.

Hyp mode always executes in Non-secure state at EL2 and has higher execution privilege than all of:
- User mode.
- System mode, Supervisor mode, Abort mode, Undefined mode, IRQ mode, and FIQ mode.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Limited use of Privilege level in ARMv8 AArch32 state on page G1-5227 describes how, in some contexts, the concept of *Privilege levels* can be used to represent the execution privilege hierarchy.

For more information about the modes, see *About the AArch32 PE modes* on page G1-5220.

Figure G1-1 shows the security model when EL3 is using AArch32, and shows the expected use of the different Exception levels, and which modes execute at which Exception levels.

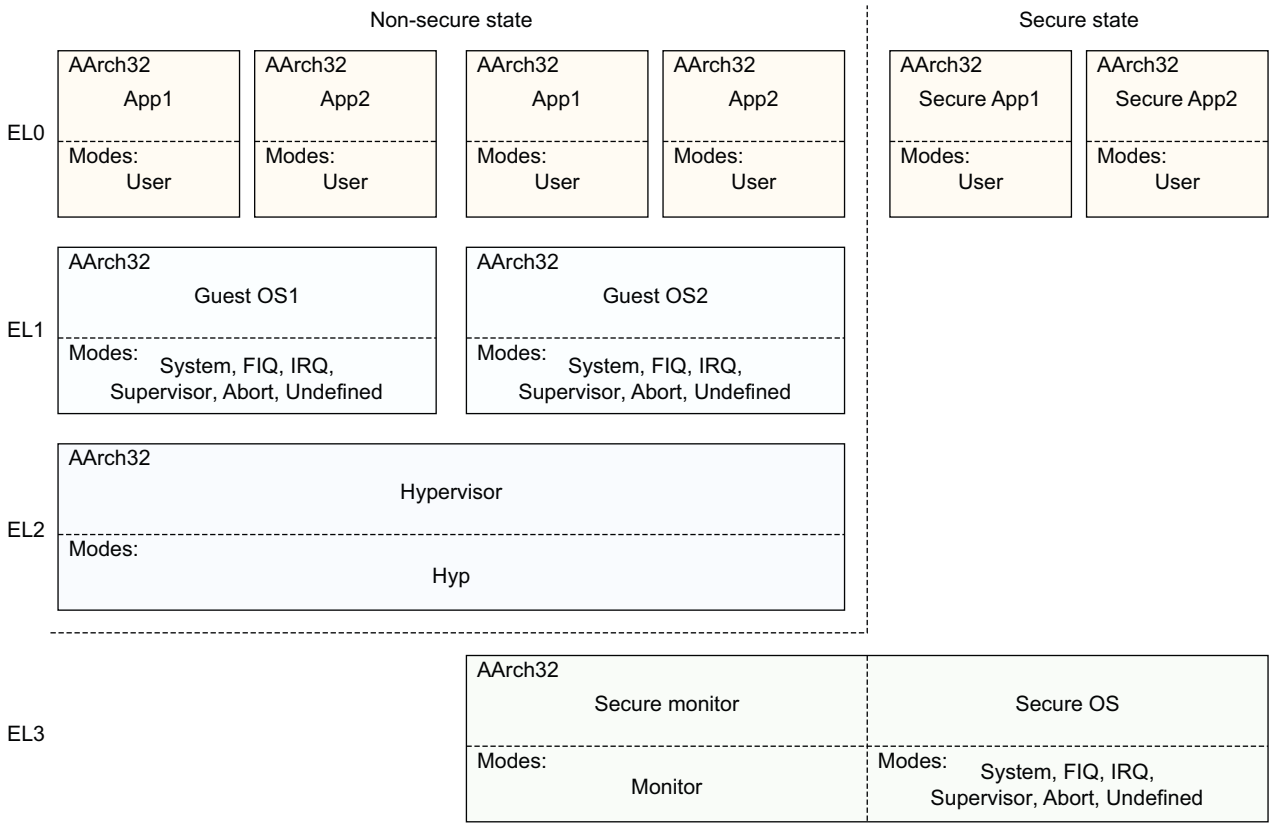

Figure G1-1 ARMv8-A Security model when EL3 is using AArch32

Note

For an overview of the Security models when EL3 is using AArch64:

- See Figure G1-2 on page G1-5233 for the case where EL2, EL1, and EL0 are all using AArch32. This figure shows the implementation of the PE modes.
- See Figure D1-1 on page D1-2139 for an overview of the set of possible implementations.

Figure G1-1 shows that when EL3 is using AArch32, the Exception levels and modes available in each Security state are as follows:

Secure state

EL0 User mode.

EL3 Any mode that is available in Secure state, other than User mode.

Non-secure state

EL0 User mode.

EL1 Any mode that is available in Non-secure state, other than Hyp mode and User mode.

EL2 Hyp mode.

Execution at EL0 is described as *unprivileged execution*.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

A mode associated with a particular Exception level, EL*n*, is described as an EL*n* mode.

Note

The Exception level defines the ability to access resources in the current Security state, and does not imply anything about the ability to access resources in the other Security state.

When EL3 is using AArch32, many AArch32 System registers accessible at PL1 are *banked* between the Secure and Non-secure states.

When EL3 is using AArch64 and Secure EL1 is using AArch32, System registers accessible at PL1 are not banked between the Non-secure and Secure states. Software running at EL3 is expected to switch the content of the PL1-accessible System registers between the Secure and Non-secure context, in a similar manner to switching the contents of general purpose registers. For information on the relationship between AArch64 and AArch32 System registers in an interprocessing environment, see *Mapping of the System registers between the Execution states* on page D1-2254.

For more information on the System registers, see *The AArch32 System register interface* on page G1-5313.

The *Secure Monitor Call* (`SMC`) instruction provides software with a system call to EL3. When executing at a privileged Exception level, `SMC` instructions generates exceptions. For more information, see *Secure Monitor Call (SMC) exception* on page G1-5287 and *SMC* on page F5-4266.

Note

For more information about the Privilege level terminology, see *Security state, Exception levels, and AArch32 execution privilege* on page G1-5226.

Changing from Secure state to Non-secure state

Monitor mode is provided to support switching between Secure and Non-secure states. When executing in an Exception level that is using AArch32, except in Monitor mode and Hyp mode, the Security state is controlled:

- By the SCR.NS bit, when EL3 is using AArch32.
- By the SCR_EL3.NS bit, when EL3 is using AArch64.

The mapping of AArch32 privileged modes to the exception hierarchy means that it is possible when EL3 is using AArch32 to change from EL3 to Non-secure EL1 without an exception return. This can occur in one of the following ways:

- Using an `MSR` or `CPS` instruction to switch from Monitor mode to another privileged mode while SCR.NS is 1.
- Using an `MCR` instruction that writes SCR.NS to change from Secure to Non-secure state when in a privileged mode other than Monitor mode.

ARM strongly recommends that software executing at EL3 using AArch32 does not use either of these mechanisms to change from EL3 to Non-secure EL1 without an exception return. The use of both of these mechanisms is deprecated.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

G1.7 Security state, Exception levels, and AArch32 execution privilege

In ARMv8, the hierarchy of software execution privilege, within a particular Security state, is defined by the Exception levels, with higher Exception level numbers indicating higher privilege. Table G1-1 shows this hierarchy for each Security state.

Table G1-1 Execution privilege and Exception levels, by Security state

Execution privilege	Secure state	Non-secure state	Typical use
Highest	EL3	-[a]	Secure monitor
-	EL2[b]	EL2	Hypervisor
-	EL1	EL1	Secure or Non-secure OS
Lowest, Unprivileged	EL0	EL0	Secure or Non-secure application

a. EL3 is never implemented in Non-secure state.
b. If ARMv8.4-SecEL2 is implemented in AArch64 state, EL2 can be enabled in Secure state.

When executing in AArch32 state, within a given Security state, the current PE state, including the execution privilege, is primarily indicated by the current *PE mode*. In Secure state, how the PE modes map onto the Exception levels depends on whether EL3 is using AArch32 or is using AArch64, and:

- Figure G1-1 on page G1-5224 shows this mapping when EL3 is using AArch32.
- Figure G1-2 on page G1-5233 shows this mapping when EL3 is using AArch64.

Table G1-2 shows this mapping. In interpreting this table:

- Monitor mode is implemented only in Secure state, and only if EL3 is using AArch32.
- Hyp mode is implemented only in Non-secure state, and only if EL2 is using AArch32.
- System, FIQ, IRQ, Supervisor, Abort, and Undefined modes are implemented:
  - **In Secure state** If either:
    - EL3 is using AArch32.
    - EL3 is using AArch64 and EL1 is using AArch32.
  - **In Non-secure state** If EL1 is using AArch32.
- User mode is implemented if EL0 is using AArch32.

Table G1-2 Mapping of AArch32 PE modes to Exception levels

Exception level	PE modes in the given Security state, and EL3 Execution state		
	Secure state, EL3 using AArch32	Secure state, EL3 using AArch64[a]	Non-secure state
EL3	Monitor, System, FIQ, IRQ, Supervisor, Abort, Undefined	-	-
EL2	-	-	Hyp
EL1	-	System, FIQ, IRQ, Supervisor, Abort, Undefined	System, FIQ, IRQ, Supervisor, Abort, Undefined
EL0	User	User	User

a. If ARMv8.4-SecEL2 is implemented and enabled in AArch64 State, this column can be applied to EL2.

Because AArch32 behavior is described in terms of the PE modes, and transitions between PE modes, the Exception levels are implicit in most of the description of operation in AArch32 state.

G1.7.1 Limited use of Privilege level in ARMv8 AArch32 state

As described in *The VMSAv8-32 translation regimes* on page G5-5466, a *translation regime* maps a virtual address (VA) to the corresponding physical address (PA). The VMSAv8-64 translation regimes are defined by the Exception levels that use them. However, because the mapping between PE modes and Exception levels in Secure state depends on whether EL3 is using AArch32 or is using AArch64, as shown in Table G1-2 on page G1-5226, the VMSAv8-32 translation regimes cannot be described simply in terms of either the Exception levels or the PE modes that use them.

To provide a consistent description of address translation as seen from AArch32 state, the VMSAv8-32 translation regimes are described in terms of the *Privilege levels* originally defined in the ARMv7 descriptions of AArch32 state. Table G1-3 shows how the PE modes map to these Privilege levels:

Table G1-3 Mapping of PE modes to AArch32 Privilege levels

Privilege level	Secure state	Non-secure state
PL2	-	Hyp[a]
PL1	Monitor[b], System, FIQ, IRQ, Supervisor, Abort, Undefined	System, FIQ, IRQ, Supervisor, Abort, Undefined
PL0	User	User

a. Implemented only in Non-secure state, and only if EL2 is using AArch32 state.
b. Implemented only in Secure state, and only if EL3 is using AArch32 state.

Comparing Table G1-3 with Table G1-2 on page G1-5226 shows that:

In Non-secure state

Each privilege level maps to the corresponding Exception level. For example PL1 maps to EL1.

In Secure state

PL0 maps to EL0.

The mapping of PL1 depends on the Execution state being used by EL3, as follows:

EL3 using AArch64 Secure PL1 maps to Secure EL1. Monitor mode is not implemented.

EL3 using AArch32 Secure PL1 maps to Secure EL3. Monitor mode is implemented as one of the Secure PL1 modes.

G1.8 Virtualization

The support for virtualization described in this section applies only to an implementation that includes EL2. A PE is in *Hyp mode* when it is executing at EL2 in the AArch32 state. An exception return from Hyp mode to software running at EL1 or EL0 is performed using the `ERET` instruction.

EL2 provides a set of features that support virtualizing the Non-secure state of an ARMv8-A implementation. The basic model of a virtualized system involves:

- A hypervisor, running in EL2, that is responsible for switching between *virtual machines*. A virtual machine is comprised of Non-secure EL1 and Non-secure EL0.
- A number of Guest operating systems, that each run in Non-secure EL1, on a virtual machine.
- For each Guest operating system, applications, that usually run in Non-secure EL0, on a virtual machine.

Note

In some systems, a Guest OS is unaware that it is running on a virtual machine, and is unaware of any other Guest OS. In other systems, a hypervisor makes the Guest OS aware of these facts. The ARMv8-A architecture supports both of these models.

The hypervisor assigns a *virtual machine identifier* (VMID) to each virtual machine.

In AArch32 state, EL2 is implemented only in Non-secure state, to support Guest OS management. EL2 provides controls to:

- Provide virtual values for the contents of a small number of identification registers. A read of one of these registers by a Guest OS or the applications for a Guest OS returns the virtual value.
- *Trap* various operations, including memory management operations and accesses to many other registers. A trapped operation generates an exception that is taken to EL2.
- Route interrupts to the appropriate one of:
  - The current Guest OS.
  - A Guest OS that is not currently running.
  - The hypervisor.

In Non-secure state:

- The implementation provides an independent *translation regime* for memory accesses from EL2.
- For the PL1&0 translation regime, address translation occurs in two stages:
  - Stage 1 maps the *virtual address* (VA) to an *intermediate physical address* (IPA). This is managed at EL1, usually by a Guest OS. The Guest OS believes that the IPA is the *physical address* (PA).
  - Stage 2 maps the IPA to the PA. This is managed at EL2. The Guest OS might be completely unaware of this stage.

For more information on the translation regimes, see Chapter G5 *The AArch32 Virtual Memory System Architecture*.

G1.8.1 The effect of implementing EL2 on the Exception model

An implementation that includes EL2 implements the following exceptions:

- Hypervisor Call (HVC) exception.
- Traps to EL2. *EL2 configurable controls* on page G1-5331, describes these.
- All of the virtual interrupts:
  - Virtual SError.
  - Virtual IRQ.
  - Virtual FIQ.

HVC exceptions are always taken to EL2. All virtual interrupts are always taken to EL1, and can only be taken from Non-secure EL1 or EL0.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Each of the virtual interrupts can be independently enabled using controls at EL2.

Each of the virtual interrupts has a corresponding physical interrupt. See *Virtual interrupts*.

When a virtual interrupt is enabled, its corresponding physical exception is taken to EL2, unless EL3 has configured that physical exception to be taken to EL3. For more information, see *Asynchronous exception behavior for exceptions taken from AArch32 state* on page G1-5274.

An implementation that includes EL2 also:

- Provides controls that can be used to route some synchronous exceptions, taken from Non-secure state, to EL2. For more information, see:
  - *Routing exceptions from Non-secure EL0 to EL2* on page G1-5262.
  - *Routing debug exceptions to EL2 using AArch32* on page G1-5264.
  - *Routing of aborts taken to AArch32 state* on page G1-5266
- Provides mechanisms to trap PE operations to EL2. See *EL2 configurable controls* on page G1-5331.

  When an operation is trapped to EL2, the hypervisor typically either:
  - Emulates the required operation. The application running in the Guest OS is unaware of the trap.
  - Returns an error to the Guest OS.

Virtual interrupts

The virtual interrupts have names that correspond to the physical interrupts, as shown in Table G1-4.

Table G1-4 The virtual interrupts

Physical interrupt	Corresponding virtual interrupt
External SError	Virtual SError
IRQ	Virtual IRQ
FIQ	Virtual FIQ

Software executing at EL2 can use virtual interrupts to signal physical interrupts to Non-secure EL1 and Non-secure EL0. Example G1-1 shows a usage model for virtual interrupts.

Example G1-1 Virtual interrupt usage model

A usage model is as follows:

1. Software executing at EL2 routes a physical interrupt to EL2.
2. When a physical interrupt of that type occurs, the exception handler executing in EL2 determines whether the interrupt can be handled in EL2 or requires routing to a Guest OS in EL1. If the interrupt requires routing to a Guest OS:
   - If the Guest OS is currently running, the hypervisor uses the appropriate virtual interrupt type to signal the physical interrupt to the Guest OS.
   - If the Guest OS is not currently running, the physical interrupt is marked as pending for the guest OS. When the hypervisor next switches to the virtual machine that is running that Guest OS, the hypervisor uses the appropriate virtual interrupt type to signal the physical interrupt to the Guest OS.

Non-secure EL1 and Non-secure EL0 modes cannot distinguish a virtual interrupt from the corresponding physical interrupt.

For more information, see *Virtual exceptions when an implementation includes EL2* on page G1-5274.

G1.9 AArch32 state PE modes, and general-purpose and Special-purpose registers

The following sections describe the AArch32 PE modes and the general-purpose registers and the PC:

- *AArch32 state PE mode descriptions*.
- *AArch32 general-purpose registers, the PC, and the Special-purpose registers* on page G1-5235.
- *Saved Program Status Registers (SPSRs)* on page G1-5237.
- *ELR_hyp* on page G1-5238.

Note

The PC is included in the scope of this section because, in AArch32 state, it is defined as being part of the same register file as the general-purpose registers. That is, the AArch32 register file R0-R15 comprises:

- The general-purpose registers R0-R14.
- The PC, that can be described as R15.

G1.9.1 AArch32 state PE mode descriptions

Table G1-5 shows the PE modes defined by the ARM architecture, for execution in AArch32 state. In this table:

- The *PE mode* column gives the name of each mode and the abbreviation used, for example, in the general-purpose register name suffixes used in *AArch32 general-purpose registers, the PC, and the Special-purpose registers* on page G1-5235.
- The *Encoding* column gives the corresponding PSTATE.M field.
- The *Exception level* column gives the Exception level at which the mode is implemented, including dependencies on the current Security state and on whether EL3 is using AArch32, see *Exception levels* on page G1-5217.

Table G1-5 AArch32 PE modes

PE mode		Encoding	Security state	Exception level	Implemented
User	usr	10000	Both	EL0	Always
FIQ	fiq	10001	Non-secure Secure	EL1 EL1 or EL3[a]	Always
IRQ	irq	10010	Non-secure Secure	EL1 EL1 or EL3[a]	Always
Supervisor	svc	10011	Non-secure Secure	EL1 EL1 or EL3[a]	Always
Monitor	mon	10110	Secure	EL3	If EL3 implemented and using AArch32
Abort	abt	10111	Non-secure Secure	EL1 EL1 or EL3[a]	Always
Hyp	hyp	11010	Non-secure	EL2	If EL2 implemented and using AArch32
Undefined	und	11011	Non-secure Secure	EL1 EL1 or EL3[a]	Always
System	sys	11111	Non-secure Secure	EL1 EL1 or EL3[a]	Always

a. EL3 if EL3 is using AArch32. EL1 if EL3 is using AArch64 and EL1 is using AArch32.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Note

ARMv8.4-SecEL2 is not supported if EL2 is using AArch32.

Mode changes can be made under software control, or can be caused by an external or internal exception.

Notes on the AArch32 PE modes

PE modes are defined only in AArch32 state. Because each mode is implemented as part of a particular Exception level that is using AArch32, the set of available modes depends on which Exception levels are implemented and using AArch32, as described in *Effect of the EL3 Execution state on the PE modes and Exception levels* on page G1-5232.

This section gives more information about each of the modes, when it is implemented.

User mode Software executing in User mode executes at EL0. Execution in User mode is sometimes described as unprivileged execution. Application programs normally execute in User mode, and any program executed in User mode:

- Makes only unprivileged accesses to system resources, meaning it cannot access protected system resources.
- Makes only unprivileged access to memory.
- Cannot change mode except by causing an exception, see *Handling exceptions that are taken to an Exception level using AArch32* on page G1-5247.

System mode System mode is implemented at EL1 or EL3, see *Effect of the EL3 Execution state on the PE modes and Exception levels* on page G1-5232.

System mode has the same registers available as User mode, and is not entered by any exception.

Supervisor mode

Supervisor mode is implemented at EL1 or EL3, see *Effect of the EL3 Execution state on the PE modes and Exception levels* on page G1-5232.

Supervisor mode is the default mode to which a Supervisor Call exception is taken. Executing an SVC (Supervisor Call) instruction generates a Supervisor Call exception.

In an implementation where the highest implemented Exception level is using AArch32, if that Exception level is EL3 or EL1, a PE enters Supervisor mode on Reset.

Abort mode Abort mode is implemented at EL1 or EL3, see *Effect of the EL3 Execution state on the PE modes and Exception levels* on page G1-5232.

Abort mode is the default mode to which a Data Abort exception or Prefetch Abort exception is taken.

Undefined mode

Undefined mode is implemented at EL1 or EL3, see *Effect of the EL3 Execution state on the PE modes and Exception levels* on page G1-5232.

Undefined mode is the default mode to which an instruction-related exception, including any attempt to execute an UNDEFINED instruction, is taken.

FIQ mode FIQ mode is implemented at EL1 or EL3, see *Effect of the EL3 Execution state on the PE modes and Exception levels* on page G1-5232.

FIQ mode is the default mode to which an FIQ interrupt is taken.

IRQ mode IRQ mode is implemented at EL1 or EL3, see *Effect of the EL3 Execution state on the PE modes and Exception levels* on page G1-5232.

IRQ mode is the default mode to which an IRQ interrupt is taken.

Hyp mode Hyp mode is the Non-secure EL2 mode.

Hyp mode is entered on taking an exception from Non-secure state that must be taken to EL2.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

In an implementation where the highest implemented Exception level is EL2 and EL2 uses AArch32 on reset, a PE enters Hyp mode on Reset.

The Hypervisor Call exception and Hyp Trap exception are implemented as part of EL2 and are always taken to Hyp mode.

Note

This means that Hypervisor Call and Hyp Trap exceptions cannot be taken from Secure state.

When the value of the Hypervisor Call enable bit, SCR.HCE, is 1, executing an `HVC` (Hypervisor Call) instruction in a Non-secure EL1 mode generates a Hypervisor Call exception.

For more information, see *Hyp mode* on page G1-5233.

Monitor mode

Monitor mode is the Secure EL3 mode. This means it is always in the Secure state, regardless of the value of the SCR.NS bit.

Monitor mode is the mode to which a Secure Monitor Call exception is taken. In a Non-secure EL1 mode, or a Secure EL3 mode, executing an `SMC` (Secure Monitor Call) instruction generates a Secure Monitor Call exception.

When EL3 is using AArch32, some exceptions that are taken to a different mode by default can be configured to be taken to EL3, see *PE mode for taking exceptions* on page G1-5257.

When EL3 is using AArch32, software executing in Monitor mode:

- Has access to both the Secure and Non-secure copies of System registers.
- Can perform an exception return to Secure state, or to Non-secure state.

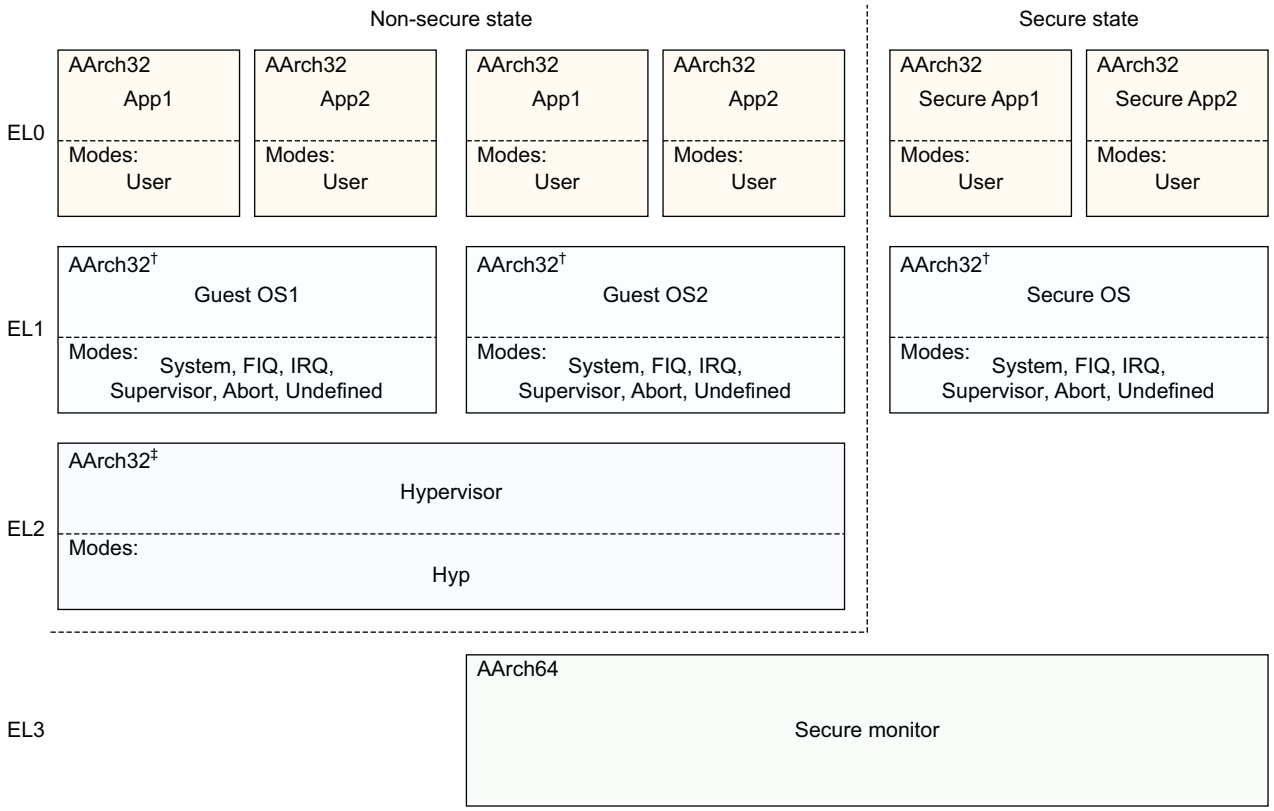
This means that, when EL3 is using AArch32, Monitor mode provides the only recommended method of changing between the Secure and Non-secure Security states.

Secure and Non-secure modes

In an implementation that includes EL3, the names of most implemented modes can be qualified as Secure or Non-secure, to indicate whether the PE is also in Secure state or Non-secure state. For example:

- If a PE is in Supervisor mode and Secure state, it is in *Secure Supervisor mode*.
- If a PE is in User mode and Non-secure state, it is in *Non-secure User mode*.

Note



As indicated in the appropriate Mode descriptions:

- Monitor mode is a Secure mode, meaning it is always in the Secure state.
- Hyp mode is a Non-secure mode, meaning it is accessible only in Non-secure state.

Effect of the EL3 Execution state on the PE modes and Exception levels

Figure G1-1 on page G1-5224 shows the PE modes, Exception levels, and Security states, for an implementation that includes all of the Exception levels, when EL3 is using AArch32. Figure G1-2 on page G1-5233 shows how the implemented modes change when EL3 is using AArch64.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

† When EL1 is using AArch64, System, FIQ, IRQ, Supervisor, Abort, and Undefined modes are not implemented
‡ When EL2 is using AArch64, Hyp mode is not implemented

Figure G1-2 ARMv8 Exception levels, and PE modes, when EL3 is using AArch64

Comparing Figure G1-1 on page G1-5224 and Figure G1-2 shows how, in Secure state only, the implementation of System, FIQ, IRQ, Supervisor, Abort, and Undefined mode depends on the Execution state that EL3 is using. That is, these modes are implemented as follows:

Non-secure state

If Non-secure EL1 is using AArch32, then System, FIQ, IRQ, Supervisor, Abort, and Undefined modes are implemented as part of EL1. Otherwise, these modes are not implemented in Non-secure state.

Secure state The implementation of these modes depends on the Execution state that EL3 is using, as follows:

EL3 using AArch64 If Secure EL1 is using AArch32, then System, FIQ, IRQ, Supervisor, Abort, and Undefined modes are implemented as part of EL1. Otherwise, these modes are not implemented in Secure state.

EL3 using AArch32 In Secure state, System, FIQ, IRQ, Supervisor, Abort, and Undefined modes are implemented as part of EL3, see Figure G1-1 on page G1-5224.

Hyp mode

Hyp mode is the Non-secure EL2 mode. When EL2 is using AArch32, it provides the usual method of controlling the virtualization of Non-secure execution at EL1 and EL0.

Note

The alternative method of controlling this functionality is by accessing the EL2 controls from EL3 with the SCR_EL3.NS or SCR.NS bit set to 1.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

This section summarizes how Hyp mode differs from the other modes, and references where this part of the manual describes the features of Hyp mode in more detail:

- Software executing in Hyp mode executes at EL2, see Figure G1-1 on page G1-5224.
- Hyp mode is accessible only in Non-secure state. In Secure state, an attempt by a CPS or an MSR instruction to change PSTATE.M to Hyp mode is an illegal change to PSTATE.M, as described in *Illegal changes to PSTATE.M* on page G1-5243.
- In Non-debug state, the only mechanisms for changing to Hyp mode are:
  - An exception taken from a Non-secure EL1 or EL0 mode.
  - When EL3 is using AArch32, an exception return from Secure Monitor mode.
  - When EL3 is using AArch64, an exception return from EL3.
- In Hyp mode, the only exception return is execution of an ERET instruction, see *ERET* on page F5-3943.
- In Hyp mode, the CPACR has no effect on the execution of;
  - System register access instructions.
  - Advanced SIMD and floating-point instructions.

  The HCPTR controls execution of these instructions in Hyp mode.
- If software running in Hyp mode executes an SVC instruction, the Supervisor Call exception generated by the instruction is taken to Hyp mode, see *SVC* on page F5-4419.
- An exception return with restored PSTATE specifying Hyp mode is an *illegal return event*, as described in *Illegal return events from AArch32 state* on page G1-5270, if any of the following applies:
  - EL3 is using AArch64 and the value of SCR_EL3.NS is 0.
  - EL3 is using AArch32 and the value of SCR.NS is 0.
  - The return is from a Non-secure EL1 mode.
- The instructions described in the following sections are UNDEFINED if executed in Hyp mode:
  - SRS. See *SRS, SRSDA, SRSDB, SRSIA, SRSIB* on page F5-4301.
  - RFE. See *RFE, RFEDA, RFEDB, RFEIA, RFEIB* on page F5-4198.
  - *LDM (exception return)* on page F5-3976.
  - *LDM (User registers)* on page F5-3978.
  - *STM (User registers)* on page F5-4341.
  - The SUBS PC, LR forms of the instructions described in *SUB, SUBS (immediate)* on page F5-4403.

    Note

    In T32 state, ERET is encoded as SUBS PC, LR, #0, and therefore this is a valid instruction.
  - The exception return form of the instructions described in *MOV, MOVS (register)* on page F5-4091.

  In addition, deprecated forms of the A32 ADCS, ADDS, ANDS, BICS, EORS, MOVS, MVNS, ORRS, RSBS, RSCS, SBCS, and SUBS instructions with the PC as the destination register are UNDEFINED if executed in Hyp mode. The instruction descriptions identify these UNDEFINED cases.
- The Load unprivileged and Store unprivileged instructions LDRT, LDRSHT, LDRHT, LDRBT, STRT, STRHT, and STRBT, are CONSTRAINED UNPREDICTABLE if executed in Hyp mode, see *Execution of Load/Store unprivileged instructions in Hyp mode* on page K1-7210.

In an implementation that includes EL3, from reset, the HVC instruction is UNDEFINED in Non-secure EL1 modes, meaning entry to Hyp mode is disabled by default. To permit entry to Hyp mode using the Hypervisor Call exception, Secure software must enable use of the HVC instruction:

- By setting the SCR_EL3.HCE bit to 1, if EL3 is using AArch64.
- By setting the SCR.HCE bit to 1, if EL3 is using AArch32.

If EL3 is implemented and using AArch32, and SCR.HCE bit is set to 0, the HVC instruction is UNPREDICTABLE in Hyp mode. The instruction is either UNDEFINED or executes as a NOP.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

If EL3 is implemented and using AArch64, and SCR_EL3.HCE bit is set to 0, the HVC instruction is UNDEFINED in Hyp mode.

If EL3 is not implemented and HCR_EL2 or HCR.HCD is set to 1, the HVC instruction is UNDEFINED in Hyp mode.

Pseudocode description of mode operations

The BadMode() function tests whether a 5-bit mode number corresponds to one of the permitted modes.

The BadMode() function is defined in Chapter J1 *ARMv8 Pseudocode*.

G1.9.2 AArch32 general-purpose registers, the PC, and the Special-purpose registers

The general-purpose registers, and the PC, in AArch32 state on page E1-3539 describes the application level view of the general-purpose registers, and the PC. This view provides:

- The general-purpose registers R0-R14, of which:
  - The preferred name for R13 is SP (*stack pointer*).
  - The preferred name for R14 is LR (*link register*).
- The PC, that can be described as R15.

These registers are selected from a larger set of registers, that includes *banked* copies of some registers, with the current register selected by the execution mode. The implementation and banking of the general-purpose registers depends on whether or not the implementation includes EL2 and EL3, and whether those Exception levels are using AArch32. Figure G1-3 on page G1-5236 shows the full set of banked general-purpose registers, and the Special-purpose registers:

- The Program Status Registers CPSR and SPSR.
- ELR_hyp.

Note

The architecture uses system level register names, such as R0_usr, R8_usr, and R8_fiq, when it must identify a specific register. The application level names refer to the registers for the current mode, and usually are sufficient to identify a register.

† Part of EL2. Exists only in Non-secure state, and only when EL2 is using AArch32.
Cells with no entry indicate that the User mode register is used.

Figure G1-3 AArch32 general-purpose registers, PC, and Special-purpose registers, showing banking

As described in *PE mode for taking exceptions* on page G1-5257, on taking an exception the PE changes mode, unless it is already in the mode to which it must take the exception. Each mode that the PE might enter in this way has:

- A banked copy of the stack pointer, for example SP_irq and SP_hyp.
- A register that holds a preferred return address for the exception. This is:
  - For the EL2 mode, Hyp mode, the Special-purpose register ELR_hyp.
  - For the other privileged modes to which exceptions can be taken, a banked copy of the link register, for example LR_und and LR_mon.
- A saved copy of PSTATE, made on exception entry, for example SPSR_irq and SPSR_hyp.

In addition, FIQ mode has banked copies of the general-purpose registers R8 to R12.

User mode and System mode share the same general-purpose registers.

User mode, System mode, and Hyp mode share the same LR.

For more information about the application level view of the SP, LR, and PC, and the alternative descriptions of them as R13, R14 and R15, see *The general-purpose registers, and the PC, in AArch32 state* on page E1-3539.

AArch32 Special-purpose registers

In AArch32 state, the Special-purpose registers are:

- The CPSR and its view as the APSR.
- The SPSR, including the banked copies SPSR_abt, SPSR_fiq, SPSR_hyp, SPSR_irq, SPSR_mon, SPSR_svc, and SPSR_und.
- The ELR_hyp.

Pseudocode description of general-purpose register and PC operations

The following pseudocode gives access to the general-purpose registers and the PC. These registers are an array, `_R[]`, indexed by parameter `n`. This array is common to AArch32 and AArch64 operation and therefore contains 31 64-bit registers. `_PC` is the Program Counter, and its definition is common to AArch32 and AArch64 operation and therefore its size is 64-bit.

`LookUpRIndex()` looks up the index value, `n`, for the specified register number and PE mode, using `RBankSelect()` to evaluates the result.

`_R[]` accesses the specified general-purpose register in the current PE mode, using `Rmode[]` to access the register, accessing `_R[]` if necessary. `SP` accesses the stack pointer, `LR` accesses the link register, and `PC` accesses the Program Counter. Each function has a non-assignment form for register reads and an assignment form for register writes, other than `PC`, which has only a non-assignment form.

`BranchTo()` performs a branch to the specified address.

The `_R[]`, `_PC`, `LR`, `SP`, `LookUpRIndex()`, `RBankSelect()`, `Rmode[]`, and `BranchTo()` functions are defined in Chapter J1 *ARMv8 Pseudocode*.

G1.9.3 Saved Program Status Registers (SPSRs)

The Saved Program Status Registers (SPSRs) are used to save PE state on taking exceptions. In AArch32 state, there is an SPSR for every mode that an exception can be taken to, as shown in Figure G1-3 on page G1-5236. For example, the SPSR for Monitor mode is called SPSR_mon.

Note

Exceptions cannot be taken to EL0.

When the PE takes an exception, PE state is saved from PSTATE in the SPSR for the mode the exception is taken to. For example, if the PE takes an exception to Monitor mode, PE state is saved in SPSR_mon. For more information on PSTATE, see *Process state, PSTATE* on page G1-5239.

Note

All PSTATE fields are saved, including those which have no direct read and write access.

Saving the PSTATE fields means the exception handler can:

- On return from the exception, restore the PE state to the values it had immediately before the exception was taken. When the PE returns from an exception, PE state is restored to the state stored in the SPSR of the mode the exception is returning from, if the exception return is made using one of:
  - ERET.
  - `LDM`.
  - The Exception return form of the instruction described in *MOV, MOVS (register)* on page F5-4091.
  - The Exception return form of the instruction described in *SUB, SUBS (immediate)* on page F5-4403.

  For example, on returning from Monitor mode, PE state is restored to the state stored in SPSR_mon. If the exception return is made using the RFE instruction, the PE restores the PE state from an SPSR valued read from memory.
- Examine the value that PSTATE had when the exception was taken, for example to determine the instruction set state and privilege level in which the instruction that caused an Undefined Instruction exception was executed.

The SPSRs are UNKNOWN on reset. Any operation in a Non-secure EL1 or EL0 mode makes SPSR_hyp unknown.

SPSR bits that are defined as RES0 on an exception taken from AArch32 state are ignored on any exception return to AArch32 state.

For more information on SPSR, see *SPSR, Saved Program Status Register* on page G8-5980.

Non-Confidential

Pseudocode description of SPSR operations

The following pseudocode gives access to the SPSRs.

The `SPSR[]` function accesses the current SPSR and is common to AArch32 and AArch64 operation.

The `SPSRWriteByInstr()` function is used by the MSR (register) and MSR (immediate) instructions to update the current SPSR.

The `SPSR[]` and `SPSRWriteByInstr()` functions are defined in Chapter J1 *ARMv8 Pseudocode*.

G1.9.4 ELR_hyp

Hyp mode does not provide its own banked copy of LR. Instead, on taking an exception to Hyp mode, the preferred return address is stored in ELR_hyp, a 32-bit Special-purpose register implemented for this purpose.

ELR_hyp can be accessed explicitly only by executing:

- An `MRS` or `MSR` instruction that targets ELR_hyp, see:
  - *MRS (Banked register)* on page F5-4108.
  - *MSR (Banked register)* on page F5-4112.

The `ERET` instruction uses the value in ELR_hyp as the return address for the exception. For more information, see *ERET* on page F5-3943.

Software execution in any Non-secure EL1 or EL0 mode makes ELR_hyp UNKNOWN.

G1.10 Process state, PSTATE

In the ARMv8-A architecture, Process state or PSTATE is an abstraction of process state information. All of the instruction sets provide instructions that operate on elements of PSTATE.

PSTATE includes all of the following:

- Fields that are meaningful only in AArch32 state.
- Fields that are meaningful only in AArch64 state.
- Fields that are meaningful in both Execution states.

PSTATE is defined in pseudocode as the `PSTATE` structure, of type `ProcState`. `ProcState` is defined in Chapter J1 *ARMv8 Pseudocode*.

The PSTATE fields that are meaningful in AArch32 state are:

The Condition flags

N Negative Condition flag.

Z Zero Condition flag.

C Carry Condition flag.

V Overflow Condition flag.

Process state, PSTATE on page E1-3541 gives more information about these.

The overflow or saturation flag

Q See *Process state, PSTATE* on page E1-3541.

The greater than or equal flags

GE[3:0] See *Process state, PSTATE* on page E1-3541.

The PE state controls

J, T Instruction set state. See *Process state, PSTATE* on page E1-3541. J is RES0. On a reset to AArch32 state, T is set to an IMPLEMENTATION DEFINED value. On taking an exception to:

- A PL1 mode using AArch32, T is set to SCTLR.TE.
- EL2 using AArch32, T is set to HSCTLR.TE.

IT[7:0] IT block state bits. See *Process state, PSTATE* on page E1-3541. On a reset or taking an exception to AArch32 state, these bits are set to 0.

E Endianness of data accesses. See *Process state, PSTATE* on page E1-3541. If an implementation provides both Big-endian and Little-endian support, then:

- On a reset to AArch32 state this bit is set to the IMPLEMENTATION DEFINED reset value of:
  - SCTLR.EE if the highest implemented Exception level is not EL2.
  - HSCTLR.EE if the highest implemented Exception level is EL2.
- On taking an exception to:
  - A PL1 mode using AArch32, this bit is set to SCTLR.EE.
  - EL2 using AArch32, this bit is set to HSCTLR.EE

IL Illegal Execution state bit. See *The Illegal Execution state exception* on page G1-5272. On a reset or taking an exception to AArch32 state, this bit is set to 0.

For information on how the J, T, IT[7:0], E, and IL fields can be accessed, see *Accessing the PE state controls and the Execution state bit* on page G1-5242.

The asynchronous exception mask bits

A SError interrupt mask bit.

I IRQ interrupt mask bit.

F FIQ interrupt mask bit.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

For each bit, the values are:

0 Exception not masked.

1 Exception masked.

On a reset to AArch32 state, these bits are set to 1.

On taking an exception to AArch32 state, one or more of these bits are set to 1.

For more information, see both:

- *Asynchronous exception masking controls* on page G1-5277.
- *PE state on exception entry* on page G1-5260.

The mode bits

M[4:0] Current mode of the PE. Table G1-5 on page G1-5230 lists the permitted values of this field. All other values are reserved. *Illegal changes to PSTATE.M* on page G1-5243 describes the effect of setting M[4:0] to a reserved value.

M[4] is:

M[4], Execution state

The current Execution state:

0 AArch64 state.

1 AArch32 state.

Note

This is consistent with the use of M[4:0] in previous versions of the architecture.

On a reset to AArch32 state, M[4:0] is set to:

- `0b10011`, meaning Supervisor mode, if the highest implemented Exception level is not EL2.
- `0b11010`, meaning Hyp mode, if the highest implemented Exception level is EL2.

On taking an exception to AArch32 state, M[4:0] is set to the target mode for the exception type.

For more information about the PE modes, see:

- *AArch32 state PE mode descriptions* on page G1-5230.
- *PE state on exception entry* on page G1-5260.

Access control bits, from ARMv8.1

PAN *Privileged Access Never* (PAN) state bit, see *About the PAN bit* on page G5-5513.

Timing control bits

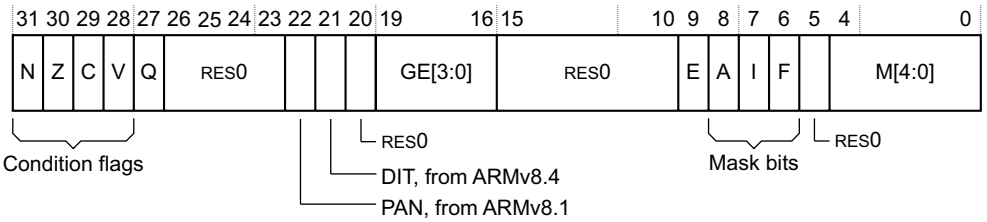
DIT *Data Independent Timing* (DIT) bit. For more information, see *About the DIT bit* on page E1-3546.

This bit is implemented only when ARMv8.4-DIT is implemented.

On a reset to AArch32 state, this bit is set to 0.

G1.10.1 Accessing PSTATE fields

The PSTATE fields can be accessed as described in the following subsections:



- *The Current Program Status Register, CPSR* on page G1-5241.
- *Accessing the PE state controls and the Execution state bit* on page G1-5242.
- *The CPS instruction* on page G1-5242.
- *The SETEND instruction* on page G1-5242.
- *The SETPAN instruction* on page G1-5243.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

The Current Program Status Register, CPSR

Some PSTATE fields can be accessed using the Special-purpose *Current Program Status Register* (CPSR). The CPSR can be directly read using the MRS instruction, and directly written using the MSR (register) and MSR (immediate) instructions.

The CPSR bit assignments are:

N, Z, C, V, bits [31:28]

The PSTATE Condition flags.

Q, bit [27] The PSTATE overflow or saturation flag.

Bits[26:23, 20, 15:10, 5]

Reserved, RES0.

Bit[22] In ARMv8.0, Reserved, RES0.

In ARMv8.1, *Privileged Access Never* (PAN) state bit, see *About the PAN bit* on page G5-5513.

DIT, bit [21] Shows the value of CPSR.DIT immediately before the exception was taken.

GE[3:0], bits [19:16]

The PSTATE greater than or equal flags.

E, bit [9] The PSTATE endianness bit.

A, I, F, bits [8:6]

The PSTATE asynchronous exception mask bits.

M[4:0], bits [4:0]

The PSTATE mode bits.

The other PSTATE fields cannot be accessed by using the CPSR. For information on how to access them, see *Accessing the PE state controls and the Execution state bit* on page G1-5242.

The application level alias for the CPSR is the APSR. The APSR is a subset of the CPSR. See *The Application Program Status Register, APSR* on page E1-3543.

Writes to the CPSR have side-effects on various aspects of PE operation. All of these side-effects, except side-effects on memory accesses associated with fetching instructions, are synchronous to the CPSR write. This means that they are guaranteed:

- Not to be visible to earlier instructions in the execution stream.
- To be visible to later instructions in the execution stream.

The privilege level and address space of memory accesses associated with fetching instructions depend on the current Exception level and Security state. Writes to PSTATE.M can change one or both of the Exception level and Security state. The effect, on memory accesses associated with fetching instructions, of a change of Exception level or Security state is:

- Synchronous to the change of Exception level or Security state, if that change is caused by an exception entry or exception return.
- Guaranteed not to be visible to any memory access caused by fetching an earlier instruction in the execution stream.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

- Guaranteed to be visible to any memory access caused by fetching any instruction after the next *Context synchronization event* in the execution stream.
- Might or might not affect memory accesses caused by fetching instructions between the mode change instruction and the point where the mode change is guaranteed to be visible.

See *Exception return to an Exception level using AArch32* on page G1-5269 for the definition of exception return instructions.

Accessing the PE state controls and the Execution state bit

The PE state controls are the PSTATE.{IL, IT[7:0], J, E, T} fields. Software can read or write these in an SPSR.

In the CPSR:

- The PE state controls, other than PSTATE.E, are RAZ when read by an MRS instruction.
- Writes to the PE state controls, other than PSTATE.E, by MSR (register) or MSR (immediate), are ignored in all modes.

Instructions other than MRS, MSR (register), or MSR (immediate) that access the PE state controls can read and write them in any mode.

Unlike the other PSTATE PE state controls, PSTATE.E can be read by an MRS instruction and might be written by MSR (register) or MSR (immediate). However, ARM deprecates PSTATE.E having a different value from the equivalent System register EE bit, see *Mixed-endian support* on page G4-5432.

Note

To determine the current endianness, software can use an `LDR` instruction to load a word from memory with a known value that differs if the endianness is reversed. For example, using an `LDR` instruction to load a word whose four bytes are `0x01`, `0x00`, `0x00`, and `0x00` in ascending order of memory address loads the destination register with:

- `0x00000001` if the current endianness is little-endian.
- `0x01000000` if the current endianness is big-endian.

The PSTATE.M[4] bit is the Execution state bit. When read by an MRS instruction in AArch32 state, this bit always reads as 1. When written by an MSR (register) instruction or MSR (immediate) instruction, writing a value other than 1 is an illegal change to the PSTATE.M field. See *Illegal changes to PSTATE.M* on page G1-5243.

The `CPS` instruction

The A32 and T32 instruction sets both include an instruction to manipulate PSTATE.{A, I, F} and PSTATE.M:

`CPSIE <iflags> {, #<mode>}`
: Sets the specified PSTATE.{A, I, F} exception masks to 0, enabling the exception, and optionally changes to the specified mode.

`CPSID <iflags> {, #<mode>}`
: Sets the specified PSTATE.{A, I, F} exception masks to 1, disabling the exception, and optionally changes to the specified mode.

`CPS #<mode>`
: Changes to the specified mode without affecting the PSTATE.{A, I, F} exception masks.

The `CPS` instruction is unconditional. For more information, see *CPS, CPSID, CPSIE* on page F5-3908.

The `SETEND` instruction

The A32 and T32 instruction sets both include an instruction to manipulate PSTATE.E:

`SETEND BE`
: Sets PSTATE.E to 1, for big-endian operation.

`SETEND LE`
: Sets PSTATE.E to 0, for little-endian operation.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

The SETEND instruction is unconditional. For more information, see *SETEND* on page F5-4248. ARM deprecates use of the SETEND instruction.

The SETPAN instruction

ARMv8.1-PAN adds the SETPAN instruction to the A32 and T32 instruction sets, to manipulate PSTATE.PAN:

SETPAN #0 Sets PSTATE.PAN to 0, disabling Privileged access-never operation.

SETPAN #1 Sets PSTATE.PAN to 1, enabling Privileged access-never operation.

The SETPAN instruction is unconditional.

- *SETPAN* on page F5-4249.
- *About the PAN bit* on page G5-5513.

G1.10.2 The Saved Program Status Registers (SPSRs)

On taking an exception, PSTATE is preserved in the SPSR of the mode to which the exception is taken. The SPSRs are described in *Saved Program Status Registers (SPSRs)* on page G1-5237.

G1.10.3 Illegal changes to PSTATE.M

In AArch32 PE modes other than User mode, MSR and CPS instructions can explicitly change PSTATE.M. The following changes to PSTATE.M by MSR or CPS instructions are illegal:

- A change to an encoding that Table G1-5 on page G1-5230 does not show.
- A change to a mode that is not implemented.
- A change to a mode that is not accessible from the context the MRS or CPS instruction is executed in, as follows:
  - A change to a mode that would cause entry to a higher Exception level.
  - When executing in Non-secure state, a change to Monitor mode.
  - When executing in Secure EL1, a change to Monitor mode when EL3 is using AArch64.
  - A change to Hyp mode from any other mode.
  - A change from Hyp mode to any other mode.
  - When the value of HCR.TGE is 1, attempting to change from Monitor mode to a Non-secure PL1 mode, see *Trapping of general exceptions to Hyp mode* on page K1-7211.

On executing an instruction that attempts an illegal change to PSTATE.M:

- PSTATE.M is unchanged, and the current mode remains unchanged.
- PSTATE.IL is set to 1.
- All other PSTATE fields are written to as normal.

Note

For the PSTATE fields that MSR and CPS instructions update, see the instruction descriptions:

- *MSR (register)* on page F5-4118.
- *MSR (immediate)* on page F5-4116.
- *CPS, CPSID, CPSIE* on page F5-3908.

When the value of PSTATE.IL is 1, any attempt to execute any instruction results in an Illegal Execution state exception. See *The Illegal Execution state exception* on page G1-5272.

Note

- The PE ignores writes to PSTATE.M when executing at PL0.
- In ARMv7, an instruction that attempts to make an illegal change to PSTATE.M is UNPREDICTABLE.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

G1.10.4 Pseudocode description of PSTATE operations

The `CPSRWriteByInstr()` function is used by the MSR (register) and MSR (immediate) instructions to update PSTATE.

The `SetPSTATEFromPSR()` function updates PSTATE from a CPSR or SPSR.

Chapter J1 *ARMv8 Pseudocode* defines these functions.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

G1.11 Instruction set states

The instruction set states are described in Chapter E2 *The AArch32 Application Level Memory Model* and application level operations on them are described there. This section supplies more information about how they interact with system level functionality, in the sections:

- *Exceptions and instruction set state*.
- *Unimplemented instruction sets*.

G1.11.1 Exceptions and instruction set state

If an exception is taken to an EL1 mode, the SCTLR.TE bit for the Security state the exception is taken to determines the instruction set state that handles the exception, and if necessary, the PE changes to this instruction set state on exception entry.

If the exception is taken to Hyp mode, the HSCTLR.TE bit determines the instruction set state that handles the exception, and if necessary, the PE changes to this instruction set state on exception entry.

On coming out of reset, if the highest implemented Exception level is using AArch32:

- If the highest implemented Exception level is EL2, the PE starts execution in Hyp mode, in the instruction set state determined by the reset value of HSCTLR.TE.
- Otherwise, the PE starts execution in Supervisor mode, in the instruction set state determined by the reset value of SCTLR.TE. If the implementation includes EL3, this execution is in Secure Supervisor mode.

For more information about exception entry, see *Overview of exception entry* on page G1-5254.

G1.11.2 Unimplemented instruction sets

The PSTATE.T bit defines the current instruction set state, see *Process state, PSTATE* on page E1-3541.

In the ARMv8 architecture, there is no support for the hardware acceleration of Java bytecodes, and the Jazelle Instruction set state is obsolete. Every AArch32 implementation must support the Trivial Jazelle implementation described in *Trivial implementation of the Jazelle extension*.

Note

In previous versions of the ARM architecture, the PSTATE.{J, T} bits determined the Instruction set state. In ARMv8, PSTATE.J is RES0.

Trivial implementation of the Jazelle extension

ARMv8 requires that the implementation of AArch32 state includes the trivial Jazelle implementation.

In a trivial implementation of the Jazelle extension:

- At EL1, EL2, or EL3, if the Exception level is using AArch32:
  - The JMCR and JOSCR are RAZ/WI.
  - The JIDR is a RAZ read-only register.
- At EL0 when EL0 is using AArch32:
  - It is IMPLEMENTATION DEFINED whether the JMCR and JOSCR are RAZ/WI or UNDEFINED.
  - It is IMPLEMENTATION DEFINED whether JIDR is RAZ or UNDEFINED.
- The `BXJ` instruction behaves identically to the `BX` instruction in all circumstances.

  Note

  This is consistent with the JMCR.JE bit being RAZ, and means that the A32 and T32 instruction sets do not provide any mechanism for attempting to enter Jazelle state.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

- Jazelle state, as defined in previous versions of the ARM architecture, is an unimplemented instruction set state.

These requirements ensure that operating systems that support an EJVM execute correctly.

A trivial implementation is not required to extend the PC to 32 bits, that is, it can implement PC[0] as RAZ/WI.

Note

This is because the only way that PC[0] is visible in A32 or T32 state is as a result of an exception occurring during Jazelle state execution, and Jazelle state execution cannot occur on a trivial implementation.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.

G1.12 Handling exceptions that are taken to an Exception level using AArch32

An exception causes the PE to suspend program execution to handle an event, such as an externally generated interrupt or an attempt to execute an undefined instruction. Exceptions can be generated by internal and external sources.

Normally, when an exception is taken the PE state is preserved immediately, before handling the exception. This means that, when the event has been handled, the original state can be restored and program execution resumed from the point where the exception was taken.

More than one exception might be generated at the same time, and a new exception can be generated while the PE is handling an exception.

The following sections describe exception handling:

- *Exception vectors and the exception base address*.
- *Exception prioritization for exceptions taken to AArch32 state* on page G1-5250.
- *Overview of exception entry* on page G1-5254.
- *PE mode for taking exceptions* on page G1-5257.
- *PE state on exception entry* on page G1-5260.
- *Routing exceptions from Non-secure EL0 to EL2* on page G1-5262.
- *Routing debug exceptions to EL2 using AArch32* on page G1-5264.

See also:

- *Routing of aborts taken to AArch32 state* on page G1-5266.
- *Exception return to an Exception level using AArch32* on page G1-5269.
- *Asynchronous exception behavior for exceptions taken from AArch32 state* on page G1-5274.
- *AArch32 state exception descriptions* on page G1-5282.

G1.12.1 Exception vectors and the exception base address

When an exception is taken, PE execution is forced to an address that corresponds to the type of exception. This address is called the *exception vector* for that exception. The vectors for the different types of exception form a *vector table*.

Note

There are significant differences in the sets of exception vectors for exceptions taken to an Exception level that is using AArch32 and for exceptions taken to an Exception level that is using AArch64. This part of this manual describes only how exceptions are taken to an Exception level that is using AArch32.

When an exception is taken to an Exception level that is using AArch64, then the exception is taken as described in Chapter D1 *The AArch64 System Level Programmers' Model* using the exception vectors described in *Exception vectors* on page D1-2159.

AArch32 state defines exception vector tables for exceptions taken to EL2 and EL3 when those Exception levels are using AArch32. Those vector tables are not used when the corresponding Exception levels are using AArch64.

A set of exception vectors for an Exception level that is using AArch32 comprises eight consecutive word-aligned memory addresses, starting at an *exception base address*. These eight vectors form an AArch32 *vector table*.

The number of possible exception base addresses, and therefore the number of vector tables, depends on the implemented Exception levels, as follows:

Implementation that does not include EL3

Any implementation that does not include EL3 must include the following AArch32 vector table if EL1 can use AArch32:

- An exception table for exceptions taken to EL1 modes other than System mode. This is the EL1 vector table, and is in the address space of the PL1&0 translation regime.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Note

Exceptions cannot be taken to System mode.

For this vector table:

— When SCTLR.V == 0, the VBAR holds the exception base address.

— When SCTLR.V == 1, the exception base address is `0xFFFF0000`.

Implementation that includes EL2

Any implementation that includes EL2 must include the following additional AArch32 vector table if EL2 can use AArch32:

- An exception table for exceptions taken to Hyp mode. This is the Hyp vector table, and is in the address space of the Non-secure PL2 translation regime.

  For this vector table, HVBAR holds the exception base address.

Implementation that includes EL3

Any implementation that includes EL3 must include the following AArch32 vector tables:

- If EL3 can use AArch32, a vector table for exceptions taken to Secure Monitor mode. This is the Monitor vector table, and is in the address space of the Secure PL1&0 translation regime.

  For this vector table, MVBAR holds the exception base address.

- If Secure EL1 can use AArch32, a vector table for exceptions taken to Secure privileged modes other than Monitor mode and System mode. This is the Secure vector table, and is in the address space of the Secure PL1&0 translation regime.

  — When the Secure instance of SCTLR.V == 0, the Secure instance of VBAR holds the exception base address.

  — When the Secure instance of SCTLR.V == 1, the exception base address is `0xFFFF0000`.

- If Non-secure EL1 can use AArch32, a vector table for exceptions taken to Non-secure PL1 modes. This is the Non-secure vector table, and is in the address space of the Non-secure PL1&0 translation regime.

  — When the Non-secure instance of SCTLR.V == 0, the Non-secure instance of VBAR holds the exception base address.

  — When the Non-secure instance of SCTLR.V == 1, the exception base address is `0xFFFF0000`.

The following subsections give more information:

- *The vector tables and exception offsets*.
- *Pseudocode determination of the exception base address* on page G1-5250.

The vector tables and exception offsets

Table G1-6 on page G1-5249 defines the AArch32 vector table entries. In this table:

- The *Hyp* column defines the vector table entries for exceptions taken to Hyp mode.
- The *Monitor* column defines the vector table entries for exceptions taken to Monitor mode.
- The *Secure* and *Non-secure* columns define the Secure and Non-secure vector table entries, that are used for exceptions taken to modes other than Monitor mode, Hyp mode, System mode, and User mode. Table G1-7 on page G1-5249 shows the mode to which each of these exceptions is taken. Each of these modes is described as the *default* mode for taking the corresponding exception.

  Note

  Exceptions cannot be taken to System mode or User mode.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

For more information about determining the mode to which an exception is taken, see *PE mode for taking exceptions* on page G1-5257.

When EL2 is using AArch32, it provides a number of additional exceptions, some of which are not shown explicitly in the vector tables. For more information, see *Interrupt offsets of AArch32 exceptions provided by EL2* on page G1-5250.

Table G1-6 The AArch32 vector tables

Offset	Vector tables			
	Hyp[a]	Monitor[b]	Secure[c]	Non-secure[c]
0x00	Not used	Not used	Not used[d]	Not used
0x04	Undefined Instruction, from Hyp mode	Monitor Trap	Undefined Instruction	Undefined Instruction
0x08	Hypervisor Call, from Hyp mode	Secure Monitor Call	Supervisor Call	Supervisor Call
0x0C	Prefetch Abort, from Hyp mode	Prefetch Abort	Prefetch Abort	Prefetch Abort
0x10	Data Abort, from Hyp mode	Data Abort	Data Abort	Data Abort
0x14	Hyp Trap, or Hyp mode entry[e]	Not used	Not used	Not used
0x18	IRQ interrupt	IRQ interrupt	IRQ interrupt	IRQ interrupt
0x1C	FIQ interrupt	FIQ interrupt	FIQ interrupt	FIQ interrupt

a. Non-secure state only. Implemented only if the implementation includes EL2 and EL2 can use AArch32.
b. Secure state only. Implemented only if the implementation includes EL3 and EL3 can use AArch32.
c. If the implementation does not include EL3 then there is a single vector table for exceptions taken to EL1 when EL1 is using AArch32. That table holds the vectors shown in the Secure column of this table
d. In previous versions of the architecture, this entry has been used for the Reset vector, meaning the address at which execution starts on coming out of reset. In ARMv8, the AArch32 Reset vector is IMPLEMENTATION DEFINED. An implementation might use this vector table entry to hold the Reset vector.
e. See *Use of offset 0x14 in the Hyp vector table* on page G1-5250.

Table G1-7 Modes for taking the exceptions shown in the Secure or Non-secure vector table

Exception	Mode taken to
Undefined Instruction	Undefined
Supervisor Call	Supervisor
Prefetch Abort	Abort
Data Abort	Abort
IRQ interrupt	IRQ
FIQ interrupt	FIQ

For more information about use of the vector tables, see *Overview of exception entry* on page G1-5254.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Interrupt offsets of AArch32 exceptions provided by EL2

EL2 provides the following exceptions. When EL2 is using AArch32, these exceptions are taken to Hyp mode, and the PE enters the handlers for these exceptions using the following vector table entries shown in Table G1-6 on page G1-5249:

Hypervisor Call

If taken from Hyp mode, shown explicitly in the Hyp mode vector table. Otherwise, see *Use of offset 0x14 in the Hyp vector table*.

Hyp Trap Shown explicitly in the Hyp mode vector table.

Virtual Abort Entered through the Data Abort vector in the Non-secure vector table.

Virtual IRQ Entered through the IRQ vector in the Non-secure vector table.

Virtual FIQ Entered through the FIQ vector in the Non-secure vector table.

Note

Virtual exceptions when an implementation includes EL2 on page G1-5274 gives more information about the virtual exceptions.

Use of offset `0x14` in the Hyp vector table

The vector at offset `0x14` in the Hyp vector table is used for all exceptions that cause entry to Hyp mode from Non-secure EL0 and EL1, except for IRQ and FIQ exceptions.

Note

Virtual exceptions are never taken to Hyp mode.

Pseudocode determination of the exception base address

For an exception taken to a PL1 mode, the `ExcVectorBase()` function determines the exception base address.

The `ExcVectorBase()` function is defined in Chapter J1 *ARMv8 Pseudocode*.

Note

The PL1 modes to which exceptions can be taken are Supervisor mode, Undefined mode, Abort mode, IRQ mode, and FIQ mode. In Non-secure state, and in Secure state when EL3 is using AArch64, these are EL1 modes. However, in Secure state when EL3 is using AArch32, these are EL3 modes. For more information see *Security state, Exception levels, and AArch32 execution privilege* on page G1-5226.

G1.12.2 Exception prioritization for exceptions taken to AArch32 state

The following sections describe the ARMv8 requirements for the prioritization of synchronous exceptions, and the limits on when asynchronous exceptions can be taken:

- *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5251.
- *Architectural requirements for taking asynchronous exceptions* on page G1-5253.

See also:

- *AArch32 state prioritization of synchronous aborts from a single stage of address translation* on page G5-5563, for information about:
  - The prioritization of aborts on a single memory access in a VMSA implementation.
  - The prioritization of exceptions generated during address translation.
- *Debug state entry and debug event prioritization* on page H2-6421 for information about the relative prioritization of exceptions and the debug events that cause entry to Debug state.

Non-Confidential

Synchronous exception prioritization for exceptions taken to AArch32 state

In principle, any single instruction can generate a number of different synchronous exceptions, between the fetching of the instruction, its decode, and eventual execution. This section describes the prioritization of such exceptions when they are taken to an Exception level that is using AArch32.

Note

- An exception that is taken to an Exception level that is using AArch32 must have been taken from an Exception level that is using AArch32.
- The priority numbering in this list correlates with the equivalent AArch64 list in *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2179.

For an exception that is taken to an Exception level that is using AArch32, exceptions are prioritized as follows, where 1 is the highest priority.

1-5 These priority numbers are used by AArch64 exceptions or debug events.

6 PC alignment fault exceptions. A PC alignment fault exception can only be taken to an Exception level that is using AArch32 as a result of:

- The CONSTRAINED UNPREDICTABLE handling of a branch to an unaligned address, see *Branching to an unaligned PC* on page K1-7192.
- Exiting from Debug state to AArch32 specifying an unaligned PC value, see *Exiting Debug state* on page H2-6454.

A PC alignment fault exception that is taken to an Exception level that is using AArch32 is reported as a Prefetch Abort exception, see *Prefetch Abort exception reporting a PC alignment fault exception* on page G1-5290.

7 Prefetch Abort exceptions. See *Prefetch Abort exception* on page G1-5289 and *AArch32 state prioritization of synchronous aborts from a single stage of address translation* on page G5-5563.

8 Breakpoint exceptions or Address Matching Vector Catch exceptions. See:

- *Breakpoint exceptions* on page G2-5374.
- *Vector Catch exceptions* on page G2-5413.

Note

An Exception Trapping Vector Catch exception is generated on exception entry for an exception that has been prioritized as described in this section. This means that it does not have its own entry in this list.

9 Illegal Execution state exceptions. See *The Illegal Execution state exception* on page G1-5272.

10 Exceptions taken from EL1 to EL2 because of one of the following configuration settings:

- HSTR.T*n*.
- HCR.TIDCP.

11 Software Breakpoint Exceptions caused by the execution of a `BKPT` Exception generating instruction.

12 Undefined Instruction exceptions that occur as a result of one or more of the following:

- An attempt to execute an unallocated instruction encoding, including an encoding for an instruction that is not implemented in the PE implementation.
- An attempt to execute an instruction that is defined never to be accessible at the current Exception level regardless of any enables or traps.
- Debug state execution of an instruction encoding that is unallocated in Debug state.
- Non-debug state execution of an instruction encoding that is unallocated in Non-debug state.
- Execution of an `HVC` instruction, when `HVC` instructions are disabled by SCR.HCE or HCR.HCD.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

- Execution of an HLT instruction when HLT instructions are disabled by EDSCR.HDE or when halting is prohibited.
- In Debug state:
  - Execution of a DCPS1 instruction in Non-secure EL0 when HCR.TGE is 1.
  - Execution of a DCPS2 instruction in EL1 or EL0 when SCR.NS is 0 or when EL2 is disabled or not implemented in the current Security state.
  - Execution of a DCPS3 instruction when EDSCR.SDD is 1 or when EL3 is not implemented.
  - When the value of EDSCR.SDD is 1, execution in EL2, EL1, or EL0 of an instruction that is trapped to EL3.
- Execution of an instruction that is UNDEFINED as a result of any of:
  - Being in an IT block when SCTLR.ITD is 1, or when HSCTLR.ITD is 1.
  - Executing a SETEND instruction when SCTLR.SED is 1, or when HSCTLR.SED is 1.
  - Executing a CP15DMB, CP15DSB, or CP15ISB barrier instruction when SCTLR.CP15BEN is 0, or when HSCTLR.CP15BEN is 0.

  See *Disabling or enabling PL0 and PL1 use of AArch32 deprecated functionality* on page G1-5325 and *Disabling or enabling EL2 use of AArch32 deprecated functionality* on page G1-5334.
- Execution of an instruction that is UNDEFINED because at least one of FPSCR.{Stride, Len} is nonzero, when programming these bits to nonzero values is supported. See *Floating-point exceptions and exception traps* on page G1-5320.

13 Exceptions taken to EL1, or taken to EL2 because the value of HCR.TGE is 1, that are generated because of configurable access to instructions, and that are not covered by any of priorities 6-12.

14 Exceptions taken from EL0 to EL2 because of one of the following configuration settings:
- HSTR.T*n*.
- HCR.TIDCP.

15 Exceptions taken to EL2 because of configuration settings in the HCPTR.

16 Exceptions taken to EL2 because of one of the following configuration settings:
- Any setting in HCR, other than the TIDCP bit.
- Any setting in CNTHCTL.
- Any setting in HDCR.

17 Exceptions taken to EL2 because of configurable access to instructions, and that are not covered by any of priorities 6-16.

18 Exceptions caused by the SMC instruction being UNDEFINED because the value of SCR.SCD is 1.

19 Exceptions caused by the execution of an Exception generating instruction, SVC, HVC, or SMC.

20-21 These priority numbers are used by AArch64 exceptions.

22 Exceptions taken to EL3 from EL0, EL1 or EL2 because of configuration settings in the SDCR.

23 Exceptions taken to EL3 because of configurable access to instructions, and that are not covered by any of priorities 6-22.

24 Trapped floating-point exceptions, if supported. See *Floating-point exceptions and exception traps* on page G1-5320.

25-26 These priority numbers are used by AArch64 exceptions and debug events.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

27 Data Abort exceptions other than a Data Abort exception generated by a synchronous External abort that was not generated by a translation table walk. That is, any Data Abort exception that is not covered by item 29. See *Data Abort exception* on page G1-5293 and *AArch32 state prioritization of synchronous aborts from a single stage of address translation* on page G5-5563. It is IMPLEMENTATION DEFINED whether synchronous External aborts are prioritized here or as item 29.

28 Watchpoint exceptions. See *Watchpoint exceptions* on page G2-5399.

29 Data Abort exception generated by a synchronous External abort that was not generated by a translation table walk, see *External aborts* on page G4-5457. It is IMPLEMENTATION DEFINED whether synchronous External aborts are prioritized here or as item 27.

For items 27-29, if an instruction results in more than one single-copy atomic memory access, the prioritization between synchronous exceptions generated on each of those different memory accesses is not defined by the architecture.

Note

Exceptions generated by a translation table walk are reported and prioritized as either a Prefetch Abort exception, priority 7 in this list, or a Data Abort exception, priority 27 in this list. See also *AArch32 state prioritization of synchronous aborts from a single stage of address translation* on page G5-5563.

Architectural requirements for taking asynchronous exceptions

The ARM architecture does not define when asynchronous exceptions are taken. The prioritization of asynchronous exceptions, including virtual asynchronous exceptions, is IMPLEMENTATION DEFINED.

An asynchronous exception that is pending before one of the following context synchronizing events is taken before the first instruction after the context synchronizing event completes its execution, provided that the pending asynchronous event is not masked:

- Execution of an `ISB` instruction that does not fail its Condition code check.
- Exception entry.
- Exception return.
- Exit from Debug state.

Note

- If the first instruction after the context synchronizing event generates a synchronous exception, then the architecture does not define the order in which that synchronous exception and the asynchronous exception are taken.
- The ISR identifies any pending asynchronous exceptions.
- Interrupts are masked when the PE is in Debug state, and therefore this list of context synchronizing events does not include the `DCPS` and `DRPS` instructions.

In the absence of a specific requirement to take an asynchronous exception, the only requirement of the architecture is that an unmasked asynchronous exception is taken in finite time.

Note

The taking of an unmasked asynchronous exception in finite time must occur with all code sequences, including with a sequence that consists of unconditional loops.

If an unmasked interrupt was pending but is changed to not pending before it is taken, then the architecture permits the interrupt to be taken, but does not require this to happen. If the interrupt is taken, then it must be taken before the first *Context synchronization event* after the interrupt was changed to not pending.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

PSTATE includes a mask bit for each type of asynchronous exception. Setting one of these bits to 1 can prevent the corresponding asynchronous exception from being taken, although when the PE is in Non-secure state other controls can modify the effect of these bits. For more information, see *Asynchronous exception behavior for exceptions taken from AArch32 state* on page G1-5274.

Taking an exception sets an exception-dependent subset of these mask bits.

Note

In some contexts, the PSTATE.{A, I, F} bits mask the taking of asynchronous exceptions. The way these are set on exception entry, described in *PSTATE.{A, I, F, M} values on exception entry* on page G1-5261, can prevent an exception handler being interrupted by an asynchronous exception.

G1.12.3 Overview of exception entry

There are some significant differences between the handling of exceptions taken to Hyp mode and exceptions taken to other modes. Because Hyp mode is the EL2 mode, this means that the following descriptions sometimes distinguish between the *EL2 mode* and the *non-EL2 modes*.

On taking an exception to an Exception level that is using AArch32:

1. The hardware determines the mode to which the exception must be taken, see *PE mode for taking exceptions* on page G1-5257.
2. A link value, indicating the *preferred return address* for the exception, is saved. This is a possible return address for the exception handler, and depends on:
   - The exception type.
   - Whether the exception is taken to the EL2 mode or to a non-EL2 mode.
   - For some exceptions taken to non-EL2 modes, the instruction set state when the exception was taken.

   Where the link value is saved depends on whether the exception is taken to the EL2 mode.

   For more information, see *Link values saved on exception entry* on page G1-5255.
3. The value of PSTATE is saved in the SPSR for the mode to which the exception must be taken. The value saved in SPSR.IT[7:0] is always correct for the preferred return address.
4. In an implementation that includes EL3, when EL3 is using AArch32:
   - If the exception is taken from Monitor mode, SCR.NS is cleared to 0.
   - Otherwise, taking the exception leaves SCR.NS unchanged.

   When EL3 is using AArch64, Monitor mode is not available.
5. PSTATE is updated with new context information for the exception handler. This includes:
   - Setting PSTATE.M to the PE mode to which the exception is taken.
   - Setting the appropriate PSTATE mask bits. This can disable the corresponding exceptions, preventing uncontrolled nesting of exception handlers.
   - Setting the instruction set state to the state required for exception entry.
   - Setting the endianness to the required value for exception entry.
   - Clearing the PSTATE.IT[7:0] bits to 0.

   For more information, see *PE state on exception entry* on page G1-5260.
6. The appropriate exception vector is loaded into the PC, see *Exception vectors and the exception base address* on page G1-5247.
7. Execution continues from the address held in the PC.

For an exception taken to a non-EL2 mode, on exception entry, the exception handler can use the SRS instruction to store the return state onto the stack of any mode at the same Exception level and in the same Security state, and can use the CPS instruction to change mode. For more information about the instructions, see *SRS, SRSDA, SRSDB, SRSIA, SRSIB* on page F5-4301 and *CPS, CPSID, CPSIE* on page F5-3908.

Non-Confidential

Later sections of this chapter describe each of the possible exceptions, and each of these descriptions includes a pseudocode description of the PE state changes on taking that exception. Table G1-8 gives an index to these descriptions:

Table G1-8 Pseudocode descriptions of exception entry for exceptions taken to AArch32 state

Exception	Description of exception entry
Reset	*Pseudocode descriptions of reset* on page G1-5307
Undefined Instruction	*Pseudocode description of taking the Undefined Instruction exception* on page G1-5284
Hyp Trap	*Pseudocode description of taking the Hyp Trap exception* on page G1-5286
Monitor Trap	*Pseudocode description of taking the Monitor Trap exception* on page G1-5285
Supervisor Call	*Pseudocode description of taking the Supervisor Call exception* on page G1-5287
Secure Monitor Call	*Pseudocode description of taking the Secure Monitor Call exception* on page G1-5288
Hypervisor Call	*Pseudocode description of taking the Hypervisor Call exception* on page G1-5289
Prefetch Abort	*Pseudocode description of taking the Prefetch Abort exception* on page G1-5293
Data Abort	*Pseudocode description of taking the Data Abort exception* on page G1-5296
Virtual Abort	*Pseudocode description of taking the Virtual SError interrupt exception* on page G1-5298
IRQ	*Pseudocode description of taking the physical IRQ exception* on page G1-5299
Virtual IRQ	*Pseudocode description of taking the Virtual IRQ exception* on page G1-5300
FIQ	*Pseudocode description of taking the FIQ exception* on page G1-5302
Virtual FIQ	*Pseudocode description of taking the Virtual FIQ exception* on page G1-5302

The following sections give more information about the PE state changes, for different architecture implementations. However, you must refer to the pseudocode for a full description of the state changes:

- *PE mode for taking exceptions* on page G1-5257.
- *PE state on exception entry* on page G1-5260.

Link values saved on exception entry

On exception entry, a link value for use on return from the exception, is saved. This link value is based on the *preferred return address for the exception*, as shown in Table G1-9:

Table G1-9 Exception return addresses for exceptions taken to AArch32 state

Exception	Preferred return address	Taken to a mode at
Undefined Instruction	Address of the UNDEFINED instruction	Non-EL2[a], or EL2[c]
Hyp Trap	Address of the trapped instruction	EL2 only[c]
Monitor Trap	Address of the trapped instruction	EL3 only
Supervisor Call	Address of the instruction after the SVC instruction	Non-EL2[a] or EL2[c]
Secure Monitor Call	Address of the instruction after the SMC instruction	EL3[b], and only in Secure state
Hypervisor Call	Address of the instruction after the HVC instruction	EL2 only[c]
Prefetch Abort	Address of aborted instruction fetch	Non-EL2[a] or EL2[c]

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Table G1-9 Exception return addresses for exceptions taken to AArch32 state (continued)

Exception	Preferred return address	Taken to a mode at
Data Abort	Address of instruction that generated the abort	Non-EL2[a] or EL2[c]
Virtual Abort	Address of next instruction to execute	EL1, and only in Non-secure state
IRQ or FIQ	Address of next instruction to execute	Non-EL2[a] or EL2[c]
Virtual IRQ or Virtual FIQ	Address of next instruction to execute	EL1, and only in Non-secure state

a. EL1 if the exception is taken to a Non-secure mode, or is taken to a Secure mode when EL3 is using AArch64. EL3 if the exception is taken to a Secure mode when EL3 is using AArch64.
b. A Secure Monitor Call exception is taken to EL3, and therefore is taken to AArch32 state only if EL3 is using AArch32, in which case it is taken to Monitor mode.
c. EL2 is implemented only in Non-secure state when using AArch32 state. Therefore, an exception can be taken to EL2 mode only if it is taken from Non-secure state when using AArch32 state.

Note

- Although Reset is described as an exception, it differs significantly from other exceptions. The architecture has no concept of a return from a Reset and therefore it is not listed in this section.
- For each exception, the preferred return address is not affected by the Exception level from which the exception was taken.

The link value saved, and where it is saved, depend on whether the exception is taken to a non-EL2 mode, or to an EL2 mode, as follows:

Exception taken to a non-EL2 mode

The link value is saved in the LR for the mode to which the exception is taken.

The saved link value is the preferred return address for the exception, plus an offset that depends on the instruction set state when the exception was taken, as Table G1-10 shows:

Table G1-10 Offsets applied to Link value for exceptions taken to non-EL2 modes

Exception	Offset, for PE state of:	
	A32	T32
Undefined Instruction	+4	+2
Monitor Trap	+4	+2
Supervisor Call	None	None
Secure Monitor Call	None	None
Prefetch Abort	+4	+4
Data Abort	+8	+8
Virtual Abort	+8	+8
IRQ or FIQ	+4	+4
Virtual IRQ or Virtual FIQ	+4	+4

Exception taken to an EL2 mode

The link value is saved in the ELR_hyp Special-purpose register.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

The saved link value is the preferred return address for the exception, as shown in Table G1-9 on page G1-5255, with no offset.

G1.12.4 PE mode for taking exceptions

The following principles determine the Exception level to which an exception is taken, and if that Exception level is using AArch32, the PE mode to which the exception is taken:

- An exception cannot be taken to the EL0 mode.
- An exception is taken either:
  - To the Exception level at which the PE was executing when it took the exception.
  - To a higher Exception level.

  This means that, in Secure state:
  - When EL3 is using AArch32, an exception is always taken to an EL3 mode.
  - When EL3 is using AArch64, an exception that is taken to AArch32 state is taken to an EL1 mode.
- Configuration options and other features provided by EL2 and EL3 can determine the mode to which some exceptions are taken, as follows:

  In an implementation that does not include EL2 or EL3

  An exception is always taken to the default mode for that exception.

  In an implementation that includes EL3

  A Secure Monitor Call exception is always taken to EL3. This means:
  - If EL3 is using AArch32 the exception is taken to Secure Monitor mode.
  - If EL3 is using AArch64, then executing the instruction generates an exception that is taken to EL3, see *Execution of an SMC instruction from a privileged Exception level that is using AArch32* on page G1-5258.

  IRQ, FIQ, and External abort exceptions can be configured to be taken to EL3. Therefore, if EL3 is using AArch32 the exceptions are taken to Secure Monitor mode.

  When EL3 is using AArch32, a Monitor Trap exception is taken to Secure Monitor mode.

  Any exception taken from Secure state that is not taken to Secure Monitor mode is taken to Secure state in the default mode for that exception. As described in *Security state, Exception levels, and AArch32 execution privilege* on page G1-5226, this means it is taken to:
  - An EL3 mode other than Monitor mode if EL3 is using AArch32.
  - An EL1 mode if EL3 is using AArch64.

  If the implementation does not include EL2, any exception taken from Non-secure state that is not taken to Secure Monitor mode is taken to Non-secure state to the default mode for that exception. The default mode will be an EL1 mode.

  In an implementation that includes EL2

  An exception taken from Non-secure state that is not taken to Secure Monitor mode is taken to Non-secure state and:
  - If the exception is taken from Hyp mode, then it is taken to Hyp mode.
  - Otherwise, the exception is either taken to Hyp mode, as described in *Exceptions taken to Hyp mode* on page G1-5258, or taken to the default mode for the exception.

  Note
  - Hyp mode is the EL2 mode. The other modes to which an exception can be taken in Non-secure state are EL1 modes.
  - Hyp mode has no effect on the handling of exceptions taken from Secure state.

Table G1-7 on page G1-5249 shows the default mode to which each exception is taken.

Asynchronous exception routing controls on page G1-5276 describes the exception routing controls provided by EL2 and EL3.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Routing of aborts taken to AArch32 state on page G1-5266 gives more information about the modes to which memory aborts are taken.

The possible modes for taking each exception on page G1-5259 shows all modes to which each exception might be taken, in any implementation. That is, it applies to implementations:

- That include neither EL2 nor EL3.
- That include EL2 but not EL3.
- That do not include EL2 but include EL3.
- That include both EL2 and EL3.

Exceptions taken to Hyp mode

In an implementation that includes EL2 and EL3, when EL2 is using AArch32:

- Any exception taken from Hyp mode, that is not routed to EL3 by the controls described in *Asynchronous exception routing controls* on page G1-5276, is taken to Hyp mode.
- The following exceptions, if taken from Non-secure state, are taken to Hyp mode:
  - An abort that *Routing of aborts taken to AArch32 state* on page G1-5266 identifies as taken to Hyp mode.
  - A Hyp Trap exception, see *EL2 configurable controls* on page G1-5331.
  - A Hypervisor Call exception. This is generated by executing an `HVC` instruction in a Non-secure mode.
  - An SError interrupt exception, IRQ exception or FIQ exception that is not routed to EL3 but is explicitly routed to Hyp mode, as described in *Asynchronous exception routing controls* on page G1-5276.
  - A synchronous External abort, Alignment fault, Undefined Instruction exception, or Supervisor Call exception taken from the Non-secure EL0 mode and explicitly routed to Hyp mode, as described in *Routing exceptions from Non-secure EL0 to EL2* on page G1-5262.

    Note

    A synchronous External abort can be routed to Hyp mode only if it is not routed to EL3.

  - A debug exception that is explicitly routed to Hyp mode as described in *Routing debug exceptions to EL2 using AArch32* on page G1-5264.

Note

The virtual exceptions cannot be taken to Hyp mode. They are always taken to a Non-secure EL1 mode.

Security behavior in Exception levels using AArch32 when EL2 or EL3 are using AArch64

As described in *The ARMv8-A security model* on page G1-5223, when EL3 is using AArch64, lower Exception levels, in either Security state, can be using AArch32. This means software executing in those Exception levels might try to access AArch32 security features that are not available. The following subsections describe the associated behaviors:

- *Execution of an SMC instruction from a privileged Exception level that is using AArch32*
- *Non-secure reads of the NSACR* on page G1-5259
- *Secure EL1 operations when Secure EL1 is using AArch32 state* on page G1-5259

Execution of an SMC instruction from a privileged Exception level that is using AArch32

When EL3 is using AArch64, an `SMC` instruction executed from Secure or Non-secure EL1 using AArch32, or from Non-secure EL2 using AArch32 when the value of HCR.TSC is 0, generates an exception that is taken to EL3. The exception syndrome is reported with an EC value of `0x13`, `SMC` instruction executed in AArch32 state, see *ISS encoding for an exception from SMC instruction execution in AArch32 state* on page D12-2775.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Non-secure reads of the NSACR

The NSACR is defined as being RO from Non-secure PE modes other than User mode. When EL3 is using AArch64, a read of the NSACR returns a fixed value of `0x00000C00` in the following cases:

- If the read is from a Non-secure EL1 mode when EL1 is using AArch32.
- If the read is from Hyp mode when EL2 is using AArch32.

Secure EL1 operations when Secure EL1 is using AArch32 state

When Secure EL1 is using AArch32 and if ARMv8.4-SecEL2 is implemented and enabled or EL3 is using AArch64:

- Any of the following operations performed in a Secure EL1 mode is trapped to Secure EL3:
  - A read or write of any of the SCR, NSACR, MVBAR, and SDCR.
  - Executing any of the ATS12NSO** instructions.
  - Executing an `SRS` instruction that would use SP_mon, see *SRS, SRSDA, SRSDB, SRSIA, SRSIB* on page F5-4301.
  - Executing an `MRS` (banked register) or `MSR` (banked register) instruction that would access SPSR_mon, SP_mon, or LR_mon, see *MRS (Banked register)* on page F5-4108 and *MSR (Banked register)* on page F5-4112.

  For more information about these traps, including the associated exception syndromes, see *Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32* on page D1-2231.
- Any attempt to move into Hypervisor mode, either by an exception return or by executing a `CPS` or `MSR` instruction, is treated as an illegal operation and is handled as described in *Illegal return events from AArch32 state* on page G1-5270.
- Any attempt to move into Monitor mode, either by an exception return or by executing a `CPS` or `MSR` instruction, is treated as an illegal operation and is handled as described in *Illegal return events from AArch32 state* on page G1-5270.

Note

This functionality supports a usage model where:

- EL3 uses AArch64.
- Secure software executed in Secure EL1 using AArch32 and Secure EL0 using AArch32.
- The Non-secure state uses AArch64.

The possible modes for taking each exception

Each of the exception descriptions in *AArch32 state exception descriptions* on page G1-5282 includes a subsection that describes the modes to which each exception can be taken. Those subsections are:

- *The PE mode to which the Undefined Instruction exception is taken* on page G1-5283.
- *The PE mode to which the Hyp Trap exception is taken* on page G1-5286.
- *The PE mode to which the Monitor Trap exception is taken* on page G1-5285.
- *The PE mode to which the Supervisor Call exception is taken* on page G1-5286.
- *The PE mode to which the Secure Monitor Call exception is taken* on page G1-5288.
- *The PE mode to which the Hypervisor Call exception is taken* on page G1-5289.
- *The PE mode to which the Prefetch Abort exception is taken* on page G1-5291.
- *The PE mode to which the Data Abort exception is taken* on page G1-5294.
- *The PE mode to which the Virtual SError interrupt exception is taken* on page G1-5298.
- *The PE mode to which the physical IRQ exception is taken* on page G1-5299.
- *The PE mode to which the Virtual IRQ exception is taken* on page G1-5300.
- *The PE mode to which the physical FIQ exception is taken* on page G1-5301.
- *The PE mode to which the Virtual FIQ exception is taken* on page G1-5302.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

These descriptions also show the vector offset for the exception entry for each mode. These descriptions assume that all Exception levels are using AArch32, meaning:

- HCR, rather than HCR_EL2, controls the routing of exceptions to EL2.
- SCR, rather than SCR_EL3, controls the routing of exceptions to EL3.

For more information about:

- Vector offsets, see *Exception vectors and the exception base address* on page G1-5247.
- The routing of synchronous External aborts or SError, IRQ, and FIQ interrupt exceptions, and the virtual exceptions, see *Asynchronous exception routing controls* on page G1-5276.

UNPREDICTABLE cases when the value of HCR.TGE is 1

When the value of HCR.TGE is 1, exceptions that would otherwise be taken to EL1 are, instead, routed to EL2, see *Routing exceptions from Non-secure EL0 to EL2* on page G1-5262. Related to this, when the value of HCR.TGE is 1, execution in a Non-secure EL1 mode is UNPREDICTABLE. ARMv8 does not constrain this UNPREDICTABLE behavior, but in ARMv8 software that follows the ARM recommendations cannot get to this state. When following the ARM recommendations, any attempt to move to a Non-secure EL1 mode when the value of HCR.TGE is 1 is either:

- An illegal exception return, see *Illegal return events from AArch32 state* on page G1-5270.
- An illegal PE mode change, see *Illegal changes to PSTATE.M* on page G1-5243.

G1.12.5 PE state on exception entry

The description of each exception includes a pseudocode description of entry to that exception, as Table G1-8 on page G1-5255 shows. The following sections describe the PE state changes on entering an exception, for different implementations and operating states. However, you must always see the exception entry pseudocode for a full description of the state changes on exception entry:

- *Instruction set state on exception entry*.
- *PSTATE.E value on exception entry* on page G1-5261.
- *PSTATE.{A, I, F, M} values on exception entry* on page G1-5261.

Note

The descriptions in these sections assume that EL2 and EL3, that control some aspects of the routing of exceptions taken from EL1 or EL0, are both using AArch32. If this is not the case:

- If EL2 is using AArch64:
  - Controls shown as provided by the HSCTLR are provided by the SCTLR_EL2.
  - Controls shown as provided by the HCR are provided by the HCR_EL2.
- If EL3 is using AArch64, controls shown as provided by the SCR are provided by the SCR_EL3.

Instruction set state on exception entry

Exception handlers can execute in either T32 state or A32 state. On exception entry, PSTATE.T is set to the required value, as determined by SCTLR.TE or HSCTLR.TE, depending on the mode the exception is taken to. Table G1-11 shows this:

Table G1-11 PSTATE.T bit value on exception entry

Mode to which exception is taken	HSCTLR.TE	SCTLR.TE	PSTATE.T	Exception handler state
Not Hyp mode	x	0	0	A32
		1	1	T32
Hyp mode	0	x	0	A32
	1	x	1	T32

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

When an implementation includes EL3 and EL3 is using AArch32, SCTLR is banked for Secure and Non-secure states, and therefore the TE bit value might be different for Secure and Non-secure states. For an exception taken to a PE mode other than Hyp mode, the SCTLR.TE bit for the Security state to which the exception is taken determines the instruction set state for the exception handler. This means the instruction set state in which an exception handler might execute depends on the Security state to which the exception is taken.

PSTATE.E value on exception entry

PSTATE.E controls the load and store endianness for data handling. Table G1-12 show the value to which this bit is set on exception entry:

Table G1-12 PSTATE.E value on exception entry

Exception mode	HSCTLR.EE	SCTLR.EE	Endianness for data loads and stores	PSTATE.E
Secure or Non-secure EL1	x	0	Little-endian	0
		1	Big-endian	1
Hyp	0	x	Little-endian	0
	1	x	Big-endian	1

PSTATE.{A, I, F, M} values on exception entry

On exception entry, PSTATE.M is set to the value for the mode to which the exception is taken, as described in *PE mode for taking exceptions* on page G1-5257.

Table G1-13 shows the cases where PSTATE.{A, I, F} bits are set to 1 on an exception entry, and how this depends on the mode and Security state to which an exception is taken. If the table entry for a particular mode and Security state does not define a value for a PSTATE.{A, I, F} bit then that bit is unchanged by the exception entry. In this table:

- The *PE mode exception is taken to* column is the mode to which the exception is taken.
- The *Non-secure* column applies to exceptions taken to Non-secure state in an implementation that includes EL3 but does not include EL2.
- The *Secure* column applies to:
  - Exceptions taken to Secure state.
  - Implementations that do not include the EL3.
  - Exceptions taken to Non-secure state in an implementation that includes EL2.

Table G1-13 PSTATE.{A, I, F} values on exception entry

PE mode exception is taken to	Security state	
	Non-secure	Secure
Hyp	If SCR.EA==0 then PSTATE.A is set to 1 If SCR.IRQ==0 then PSTATE.I is set to 1 If SCR.FIQ==0 then PSTATE.F is set to 1	-
Monitor	-	PSTATE.A is set to 1 PSTATE.I is set to 1 PSTATE.F is set to 1

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Table G1-13 PSTATE.{A, I, F} values on exception entry (continued)

PE mode exception is taken to	Security state	
	Non-secure	Secure
FIQ	PSTATE.A is set to 1 PSTATE.I is set to 1 PSTATE.F is set to 1	PSTATE.A is set to 1 PSTATE.I is set to 1 PSTATE.F is set to 1
IRQ, Abort	PSTATE.A is set to 1 PSTATE.I is set to 1	PSTATE.A is set to 1 PSTATE.I is set to 1
Undefined, Supervisor	PSTATE.I is set to 1	PSTATE.I is set to 1

Asynchronous exception behavior for exceptions taken from AArch32 state on page G1-5274 describes how, in some situations, the PSTATE.{A, I, F} bits mask the taking of SError interrupts, IRQ interrupts, and FIQ interrupts.

G1.12.6 Routing exceptions from Non-secure EL0 to EL2

Note

The routing control described in this section permits a Non-secure state usage model where applications execute in User mode under a hypervisor, that executes in Hyp mode, without a Guest OS running at Non-secure EL1. This control applies when the PE is executing in Non-secure EL0 using AArch32 and EL2 is using AArch32 and the value of HCR.TGE is 1.

If the PE is in Non-secure User mode, any exception that would otherwise be taken to Non-secure EL1 is taken to EL2 if either:

- EL2 is using AArch32 and the value of HCR.TGE is 1.

  In this case the exception is taken to Hyp mode, instead of to the default Non-secure mode for handling the exception. For more information see *Exception reporting when HCR.TGE routes an exception to EL2 using AArch32* on page G1-5263.

- EL2 is using AArch64 and the value of HCR_EL2.TGE is 1.

  In this case the exception is taken to EL2 using AArch64, see *Exception entry* on page D1-2158.

Any exception that is routed to Secure Monitor mode or to EL3 using AArch64 is unaffected by the value of HCR.TGE or HCR_EL2.TGE.

When the value of HCR.TGE is 1, meaning TGE routing from Non-secure EL0 using AArch32 to EL2 using AArch32 applies:

- The SCTLR.M bit is treated as 0 for all purposes other than a direct read of the SCTLR register.
- Each of the HCR.{FMO, IMO, AMO} bits is treated as 1 for all purposes other than a direct read of the HCR register
- Each of the HDCR.{TDE, TDA, TDRA, TDOSA} bits is treated as 1 for all purposes other than a direct read of the HDCR register.
- An exception return to Non-secure EL1 is treated as an illegal exception return, see *Illegal return events from AArch32 state* on page G1-5270.
- All virtual interrupts, including any IMPLEMENTATION DEFINED mechanisms for signaling virtual interrupts, are disabled.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Exception reporting when HCR.TGE routes an exception to EL2 using AArch32

The following sections give more information about the behavior of synchronous exceptions that are routed to Hyp mode because the value of HCR.TGE is 1:

- *Undefined Instruction exception, when the value of HCR.TGE is 1*.
- *Supervisor Call exception, when the value of HCR.TGE is 1*.
- *Abort exceptions, when the value of HCR.TGE is 1*.
- *Reporting of exceptions routed to EL2 using AArch32 because the value of HCR.TGE is 1* on page G1-5264.

Undefined Instruction exception, when the value of HCR.TGE is 1

When HCR.TGE is set to 1, if the PE is executing in Non-secure User mode and attempts to execute an UNDEFINED instruction, it takes the Hyp Trap exception, instead of an Undefined Instruction exception. On taking the Hyp Trap exception, the HSR reports an unknown reason for the exception, using the EC value `0x00`. For more information see *Use of the HSR* on page G5-5580.

Supervisor Call exception, when the value of HCR.TGE is 1

When HCR.TGE is set to 1, if the PE executes an SVC instruction in Non-secure User mode, the Supervisor Call exception generated by the instruction is taken to Hyp mode.

The HSR reports that entry to Hyp mode was because of a Supervisor Call exception, and:

- If the SVC is unconditional, takes for the `imm16` value in the HSR:
  - A zero-extended 8-bit immediate value for the T32 SVC instruction.

    Note

    The only T32 encoding for SVC is a 16-bit instruction encoding.

  - The bottom16 bits of the immediate value for the A32 SVC instruction.
- If the SVC is conditional, the `imm16` value in the HSR is UNKNOWN.

If the SVC is conditional, the PE takes the exception only if the instruction passes its Condition code check.

The HSR reports the exception as a Supervisor Call exception taken to Hyp mode, using the EC value `0x11`. For more information, see *Use of the HSR* on page G5-5580.

Note

The effect of setting HCR.TGE to 1 is to route the Supervisor Call exception to Hyp mode, not to trap the execution of the SVC instruction. This means that the preferred return address for the exception, when routed to Hyp mode in this way, is the instruction after the SVC instruction.

Abort exceptions, when the value of HCR.TGE is 1

When the value of HCR.TGE is 1, if the PE is executing in Non-secure User mode then any abort exception that is not routed to Secure Monitor mode or to EL3 using AArch64 generates an exception that is taken as a Hyp Trap exception. Where an attempt to execute an instruction causes an abort, on taking the Hyp Trap exception, the HSR indicates whether a Data Abort exception or a Prefetch Abort exception caused the Hyp Trap exception entry, and presents a valid syndrome in the HSR.

When SCR.EA is set to 1, External aborts and SError interrupts are routed to EL3, and this routing takes priority over the HCR.TGE routing. For more information, see *Routing of aborts taken to AArch32 state* on page G1-5266.

An SError interrupt that is routed to Hyp mode because the value of HCR.TGE is 1 is reported as a Data Abort exception routed to Hyp mode.

The HSR reports the exception either:

- As a Prefetch Abort exception routed to Hyp mode, using the EC value `0x20`.
- As a Data Abort exception routed to Hyp mode, using the EC value `0x24`.

For more information about the exception reporting, see *Use of the HSR* on page G5-5580.

Reporting of exceptions routed to EL2 using AArch32 because the value of HCR.TGE is 1

PL1 configurable controls on page G1-5323 describes controls that, when the value of HCR.TGE is 0, can generate exceptions that are taken from Non-secure EL0 to EL1. When EL2 is using AArch32 and the value of HCR.TGE is 1, the exceptions generated by these controls are routed to Hyp mode. Table G1-14 shows how these exceptions are then reported in the HSR.

Table G1-14 Syndrome reporting in HSR from HCR.TGE routing of traps, disables, and enables

Control provided by PL1	Control type[a]	Syndrome reporting in HSR
SCTLR.{nTWE, nTWI}	T	Uses EC value `0x00`, Exception for an unknown reason
SCTLR.{SED, ITD}	D	Uses EC value `0x00`, Exception for an unknown reason
SCTLR.CP15BEN	E	Uses EC value `0x00`, Exception for an unknown reason
CPACR.TRCDIS	T	Uses EC value `0x00`, Exception for an unknown reason
CPACR.{cp11, cp10}	E	Uses EC value `0x00`, Exception for an unknown reason
FPEXC.EN	E	Uses EC value `0x00`, Exception for an unknown reason
CPACR.ASEDIS	D	Uses EC value `0x00`, Exception for an unknown reason
DBGDSCRext.UDCCdis	T	Uses EC value `0x00`, Exception for an unknown reason
CNTKCTL.{PL0PTEN, PL0VTEN, PL0PCTEN, PL0VCTEN}	T	Uses EC value `0x00`, Exception for an unknown reason
PMUSERENR.{ER, CR, SW, EN}	T	Uses EC value `0x00`, Exception for an unknown reason

a. T indicates a trap control, E indicates an instruction enable, and D indicates an instruction disable. For the definition of these terms, see the list that begins with *Instruction enables and instruction disables* on page G1-5322.

G1.12.7 Routing debug exceptions to EL2 using AArch32

When the value of HDCR.TDE is 1, if the PE is executing in a Non-secure mode other than Hyp mode, any Debug exception is routed to Hyp mode. This means it generates a Hyp Trap exception. This applies to:

- Debug exceptions associated with an instruction fetch, that would otherwise generate a Prefetch Abort exception. These are the Breakpoint, Breakpoint Instruction, and Vector Catch exception, see Chapter G2 *AArch32 Self-hosted Debug*.
- Watchpoint exceptions associated with data accesses, that would otherwise generate a Data Abort exception. See *Watchpoint exceptions* on page G2-5399.

When the value of HDCR.TDE is 1, each of the HDCR.{TDRA, TDOSA, TDA} bits is treated as 1 for all purposes other than reading the HDCR register.

Note

- A Breakpoint or Watchpoint debug event that generates entry to Debug state cannot be trapped to Hyp mode. See *Breakpoint and Watchpoint debug events* on page H2-6420.
- When HDCR.TDE is set to 1, the Hyp Trap exception is generated instead of the Prefetch Abort exception or Data Abort exception that is otherwise generated by the Debug exception.
- Debug exceptions, other than Breakpoint Instruction exceptions, are never generated in Hyp mode.

When a Hyp Trap exception is generated because the value of HDCR.TDE is 1, The HSR reports the exception either:

- As a Prefetch Abort exception routed to Hyp mode, using the EC value `0x20`.
- As a Data Abort exception routed to Hyp mode, using the EC value `0x24`.

G1.13 Routing of aborts taken to AArch32 state

A memory abort is either a Data Abort exception or a Prefetch Abort exception. When executing in AArch32 state, depending on the cause of the abort, and possibly on configuration settings, an abort is taken either:

- To the Exception level of the PE mode from which the abort is taken. In this case the abort is taken to AArch32 state.
- To a higher Exception level. In this case the Exception level to which the abort is taken is either:
  - Using AArch32. In this case, this chapter describes how the abort is handled.
  - Using AArch64. In this case, Chapter D5 *The AArch64 Virtual Memory System Architecture* describes how the abort is handled.

For an abort taken to an Exception level that is using AArch32, the mode to which a memory abort is taken depends on the reason for the exception, the mode the PE is in when it takes the exception, and configuration settings, as follows:

Memory aborts taken to Monitor mode

If an implementation includes EL3, when the value of SCR.EA is 1, all External aborts are taken to EL3, and if EL3 is using AArch32 they are taken to Monitor mode. This applies to aborts taken from Secure modes and from Non-secure modes.

Memory aborts taken to Secure Abort mode

If an implementation includes EL3, when the PE is executing in Secure state, all memory aborts that are not routed to EL3 are taken to Secure Abort mode.

Note

The only memory aborts that can be routed to Monitor mode are External aborts.

Memory aborts taken to Hyp mode

If an implementation includes EL2, when the PE is executing in Non-secure state, the following aborts are taken to EL2. If EL2 is using AArch32 this means they are taken to Hyp mode:

- Alignment faults taken:
  - When the PE is in Hyp mode.
  - When the PE is in a Non-secure PL1 or EL0 mode and the exception is generated because the Non-secure PL1&0 stage 2 translation identifies the target of an unaligned access as any type of Device memory.
  - When the PE is in Non-secure User mode and HCR.TGE is set to 1. For more information see *Abort exceptions, when the value of HCR.TGE is 1* on page G1-5263.
- When the PE is using the Non-secure PL1&0 translation regime:
  - MMU faults from stage 2 translations, for which the stage 1 translation did not cause an MMU fault.
  - Any abort taken during the stage 2 translation of an address accessed in a stage 1 translation table walk that is not routed to Secure Monitor mode, see *Stage 2 fault on a stage 1 translation table walk* on page G5-5561.
- When the PE is using the Non-secure EL2 translation regime, MMU faults from stage 1 translations.

  Note

  The Non-secure EL2 translation regime has only one stage of translation.

- External aborts, if SCR.EA is set to 0 and any of the following applies:
  - The PE was executing in Hyp mode when it took the exception.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

  - The PE was executing in a Non-secure PL1 or EL0 mode when it took the exception, the abort is asynchronous, and HCR.AMO is set to 1. For more information see *Asynchronous exception routing controls* on page G1-5276.
  - The PE was executing in the Non-secure User mode when it took the exception, the abort is synchronous, and HCR.TGE is set to 1. For more information see *Abort exceptions, when the value of HCR.TGE is 1* on page G1-5263.
  - The RAS Extension is implemented, the PE was executing in a Non-secure PL1 or EL0 mode when it took the exception, the abort is synchronous, and the value of HCR2.TEA is 1.
  - The abort occurred on a stage 2 translation table walk.
- Debug exceptions, if HDCR.TDE is set to 1. For more information, see *Routing debug exceptions to EL2 using AArch32* on page G1-5264.

Memory aborts taken to Non-secure Abort mode

In an implementation that does not include EL3, all memory aborts that are taken to an Exception level that is using AArch32 are taken to Abort mode.

Otherwise, when the PE is executing in Non-secure state, the following aborts are taken to Non-secure Abort mode:

- When the PE is in a Non-secure PL1 or EL0 mode, Alignment faults taken for any of the following reasons:
  - SCTLR.A is set to 1.
  - An instruction that does not support unaligned accesses is committed for execution, and the instruction accesses an unaligned address.
  - The PL1&0 stage 1 translation identifies the target of an unaligned access as any type of Device memory.

    Note

    In an implementation that does not include EL2, this case results in a CONSTRAINED UNPREDICTABLE memory access, see *Cases where unaligned accesses are CONSTRAINED UNPREDICTABLE* on page E2-3587 and *Loads and Stores to unaligned locations* on page K1-7192.

  If an implementation includes EL2 and the PE is in Non-secure User mode, these exceptions are taken to Abort mode only if the value of HCR.TGE is 0.
- When the PE is using the Non-secure PL1&0 translation regime, an MMU fault from a stage 1 translation.
- External aborts, if the PE was executing in a Non-secure PL1 or EL0 mode when it took the exception and both:
  - The value of SCR.EA is 0, meaning the abort is not taken to EL3.
  - The abort is not taken to EL2 for one of the reasons defined in Memory aborts taken to Hyp mode.
- Virtual Aborts, see *Virtual exceptions when an implementation includes EL2* on page G1-5274.
- When the value of HDCR.TDE is 0, Debug exceptions. For more information, see *Routing debug exceptions to EL2 using AArch32* on page G1-5264.

Note

If EL0 is using AArch32 and EL1 is using AArch64 then any of these memory aborts taken from User mode are taken to EL1 as described in Chapter D5 *The AArch64 Virtual Memory System Architecture*.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Memory aborts with IMPLEMENTATION DEFINED behavior

In addition, a PE can generate an abort for an IMPLEMENTATION DEFINED reason associated with lockdown. In an implementation that includes EL2, whether such an abort is taken to Non-secure Abort mode or is taken to EL2 is IMPLEMENTATION DEFINED, and an implementation might include a mechanism to select whether the abort is routed to Non-secure Abort mode or to EL2.

When the PE is in a Non-secure mode other than Hyp mode, if multiple factors cause an Alignment fault, the abort is taken to Non-secure Abort mode if any of the factors require the abort to be taken to Abort mode. For example, if the SCTLR.A bit is set to 1, and the access is an unaligned access to an address that the stage 2 translation tables mark as Device-nGnRnE, then the abort is taken to Non-secure Abort mode.

For more information see *Handling exceptions that are taken to an Exception level using AArch32* on page G1-5247.

Non-Confidential

G1.14 Exception return to an Exception level using AArch32

In the ARM architecture, *exception return* to an Exception level that is using AArch32 requires the simultaneous restoration of the PC and PSTATE to values that are consistent with the desired state of execution on returning from the exception. Typically, exception return involves returning to one of:

- The instruction after the instruction boundary at which an asynchronous exception was taken.
- The instruction following an `SVC`, `SMC`, or `HMC` instruction, for an exception generated by one of those instructions.
- The instruction that caused the exception, after the reason for the exception has been removed.
- The subsequent instruction, if the instruction that caused the exception has been emulated in the exception handler.

The ARM architecture defines a *preferred return address* for each exception other than Reset, see *Link values saved on exception entry* on page G1-5255. The values of the SPSR.IT[7:0] bits generated on exception entry are always correct for this preferred return address, but might require adjustment by the exception handler if returning elsewhere.

In some cases, to calculate the appropriate preferred return address for a return to an Exception level that is using AArch32, a subtraction must be performed on the link value saved on taking the exception. The description of each exception includes any value that must be subtracted from the link value, and other information about the required exception return.

On an exception return, the PSTATE takes either:

- The value loaded by the `RFE` instruction.
- If the exception return is not performed by executing an `RFE` instruction, the value of the current SPSR at the time of the exception return.

Illegal return events from AArch32 state on page G1-5270 describes the behavior if the restored PE state would not be valid for the Exception level, PE mode, and Security state targeted by the exception return.

G1.14.1 Exception return instructions

The instructions that an exception handler can use to return from an exception depend on whether the exception was taken to an EL1 mode, or in an EL2 mode, see:

- *Return from an exception taken to a PE mode other than Hyp mode*.
- *Return from an exception taken to Hyp mode* on page G1-5270.

Return from an exception taken to a PE mode other than Hyp mode

For an exception taken to a PE mode other than Hyp mode, the ARM AArch32 architecture provides the following *exception return instructions*:

- From privileged modes other than System mode, the `ERET` instruction. After the exception return, execution resumes from the address held in the LR (R14) for the mode in which `ERET` is executed. See *ERET* on page F5-3943.
- Data-processing instructions with the S bit set and the PC as a destination, see *MOV, MOVS (register)* on page F5-4091 and *SUB, SUBS (immediate)* on page F5-4403.

  Note

  The A32 instruction set includes other instructions that can be used for an exception return, but ARM deprecates any use of those instructions.

  Typically:

  — A return where no subtraction is required uses `SUBS` with an operand of 0, or the equivalent `MOVS` instruction.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

— A return requiring subtraction uses SUBS with a nonzero operand.

- The RFE instruction, see *RFE, RFEDA, RFEDB, RFEIA, RFEIB* on page F5-4198. If a subtraction is required, typically it is performed before saving the LR value to memory. After the exception return, execution resumes from the address held in the memory location indicated by the base register specified by the RFE instruction.
- In A32 state, a form of the LDM instruction in which the PC is one of the registers loaded, see *LDM (exception return)* on page F5-3976. If a subtraction is required, typically it is performed before saving the LR value to memory.

Return from an exception taken to Hyp mode

For an exception taken to Hyp mode, the ARM architecture provides the ERET instruction, see *ERET* on page F5-3943. An exception handler executing in Hyp mode must return using the ERET instruction.

Hyp mode is implemented only as part of EL2.

G1.14.2 Alignment of exception returns

The T bit of the value transferred to the PSTATE by an exception return controls the target instruction set of that return. The behavior of the hardware for exception returns for different values of the T bit is as follows:

T == 0 The target instruction set state is A32 state. Bits[1:0] of the address transferred to the PC are ignored by the hardware.

T == 1 The target instruction set state is T32 state:
- Bit[0] of the address transferred to the PC is ignored by the hardware.
- Bit[1] of the address transferred to the PC is part of the instruction address.

Note

In previous versions of the ARM architecture, the PSTATE.{J, T} bits determined the Instruction set state. In ARMv8, PSTATE.J is RES0.

ARM deprecates any dependence on the requirements that the hardware ignores bits of the address. ARM recommends that the address transferred to the PC for an exception return is correctly aligned for the target instruction set.

After an exception entry other than Reset, the LR value has the correct alignment for the instruction set indicated by the SPSR.T bit. This means that if exception return instructions are used with the LR and SPSR values produced by such an exception entry, the only precaution software needs to take to ensure correct alignment is that any subtraction is of a multiple of four if returning to A32 state, or a multiple of two if returning to T32 state.

G1.14.3 Illegal return events from AArch32 state

Throughout this section:

Return In AArch32 state, refers to any of:
- Execution of any exception return instruction.
- Execution of a DRPS instruction in Debug state.
- Exit from Debug state.

If an exception or debug return from an Exception level using AArch32 triggers an illegal exception return, then bit[1] of the PC is either:
- Zero.
- The value of bit[1] of the return address for the exception or debug return.

The choice between these two alternatives is made by the implementation, and might differ from instance to instance of an illegal exception return.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Note

This means software must support both alternatives.

Saved process state value
In AArch32 state, refers to any of:

- The value held in the SPSR for any exception return other than an exception return made by executing an RFE instruction.
- The value read from memory that is to be restored to PSTATE by the execution of an RFE instruction.
- The value held in the SPSR for the execution of a DRPS instruction in Debug state.
- The value held in the DSPSR for a Debug state exit.

Link address In AArch32 state, refers to any of:

- The address held in the link register for any exception return other than an exception return made by executing an ERET, LDM, or RFE instruction.
- The address held in ELR_hyp for any exception return made by executing an ERET instruction.
- The address read from memory that is to be restored to the PC by the execution of an LDM or RFE instruction.
- The address held in the DLR for Debug state exit.

Configured from reset
Indicates the state determined on powerup or reset by a configuration input signal, or by another IMPLEMENTATION DEFINED mechanism.

The ARMv8 architecture has a generic mechanism for handling exception or debug returns to a mode or state that is illegal. In AArch32 state, this can occur as a result of any of the following situations:

- A return where the Exception level being returned to is higher than the current Exception level.
- A return where the mode being returned to is not implemented. For example:
  - A return to Hyp mode when EL2 is not implemented.
  - A return to Monitor mode, when EL3 is either not implemented or using AArch64 state.
- A return to EL2 when:
  - EL3 is implemented and using AArch64, and the values of SCR_EL3.{NS, EEL2} are 0.
  - EL3 is implemented and using AArch32, and the value of the SCR.NS bit is 0.
- A return to Non-secure EL1 when:
  - EL2 is implemented and using AArch64, and the value of the HCR_EL2.TGE bit is 1.
  - EL2 is implemented and using AArch32, and the value of the HCR.TGE bit is 1.
- A return where the value of the saved process state M[4:0] field is not a valid AArch32 PE mode for the implementation. Table G1-5 on page G1-5230 shows the valid M[4:0] values for AArch32 PE modes.

In these cases:

- PSTATE.IL is set to 1, to indicate an illegal return.
- PSTATE.M is unchanged. This means the PE mode does not change.
- The SS bit is handled in the same way as any other exception or debug return, see *Software Step exceptions* on page D2-2317.
- The following PSTATE bits are restored from the saved process state value:
  - The N, Z, C, V Condition flags.
  - The Q Overflow or saturation flag.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

  - The GE Greater than or Equal flags.
  - The E Endianness mapping bit.
  - The A, I, F exception mask bits.
  - The DIT Data Independent Timing bit.
- The PSTATE.{IT, T} bits are each either:
  - Set to 0.
  - Copied from the saved process state in the SPSR for the PE mode in which the exception is handled.

  The choice between these two options is determined by an implementation, and might vary dynamically within an implementation. Correspondingly software must regard the value as being an UNKNOWN choice between the two values.
- The PC is restored from the link address, unless the illegal return is the execution of a DRPS instruction in Debug state.

When the value of the PSTATE.IL bit is 1, any attempt to execute any instruction results in an Illegal Execution state exception. See *The Illegal Execution state exception*.

All aspects of the illegal return, other than the effects described in this section, are the same as for a legal return.

G1.14.4 Legal returns that set PSTATE.IL to 1

In this section, return, saved process state value, and link address have the meaning that is defined in *Illegal return events from AArch32 state* on page G1-5270.

If the IL bit in the saved process state value is 1, then it is copied to PSTATE meaning that PSTATE.IL is set to 1. In this case, the PSTATE.{IT, T} bits are each either:

- Set to 0.
- Copied from the SPSR, or loaded from memory if the exception return was performed by executing an RFE instruction.

The choice between these two options is determined by an implementation, and might vary dynamically within the implementation. This means software must regard each value as being an UNKNOWN choice between the two permitted values.

Because the return sets the PSTATE.IL bit to 1, any attempt to execute any instruction results in an Illegal Execution state exception. See *The Illegal Execution state exception*.

G1.14.5 The Illegal Execution state exception

When the value of the PSTATE.IL bit is 1, any attempt to execute an instruction generates an Illegal Execution state exception. In AArch32 state, the PSTATE.IL bit can be set to 1 by one of the following:

- An illegal return, as described in *Illegal return events from AArch32 state* on page G1-5270.
- An illegal change to PSTATE.M, as described in *Illegal changes to PSTATE.M* on page G1-5243.
- A legal return that sets PSTATE.IL to 1, as described in *Legal returns that set PSTATE.IL to 1*.

An Illegal Execution state exception is taken in the same way as an Undefined Instruction exception in the current Exception level. If the current Exception level is EL2 using AArch32 state, the HSR provides additional syndrome information for the exception, see *Use of the HSR* on page G5-5580.

An Illegal Execution state exception has priority over any other Undefined Instruction exception that might arise from instruction execution.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Note

This section only describes the handling of an Illegal Execution state exception that is taken to an Exception level that is using AArch32 state. *The Illegal Execution state exception* on page D1-2170 describes the cases where an Illegal Execution state exception is taken to an Exception level that is using AArch64 state.

On taking any exception to an Exception level that is using AArch32 state:

1. The value of the PSTATE.IL bit is 1 and this is copied to the SPSR.IL bit for the PE mode to which the exception is taken.
2. The PSTATE.IL bit is cleared to 0.

Note

This means that it is not possible for software to observe the value of PSTATE.IL.

Pseudocode description of exception return

The `AArch32.ExceptionReturn()` function transfers the return address to the PC and restores PSTATE to its saved value.

This function uses the function `SetPSTATEFromPSR()`.

The `IllegalExceptionReturn()` function checks for an Illegal Execution state exception.

Chapter J1 *ARMv8 Pseudocode* includes the definitions of these functions.

G1.15 Asynchronous exception behavior for exceptions taken from AArch32 state

In an implementation that does not include EL2 or EL3, the asynchronous exceptions behave as follows when EL1 and EL0 are both using AArch32:

- An SError interrupt is taken to Abort mode.
- An IRQ exception is taken to IRQ mode.
- An FIQ exception is taken to FIQ mode.

These are the *default PE modes* for taking these exceptions.

Note

The SError interrupt replaces the ARMv7 asynchronous abort. The new name better describes the nature of the exception.

However, the PSTATE.{A, I, F} bits *mask* the asynchronous exceptions, meaning that when the value of one of these PSTATE bits is 1, the corresponding exception is not taken.

If a masked asynchronous exception remains signaled, then the exception remains pending unless the value of the PSTATE bit is changed to 0.

EL2 and EL3 provide controls that affect:

- The routing of these exceptions, see *Asynchronous exception routing controls* on page G1-5276.
- Masking of these exceptions in Non-secure state, see *Asynchronous exception masking controls* on page G1-5277.

Similar register control bits are provided regardless of whether EL2 and EL3 are using AArch32 or AArch64:

- The EL2 controls are provided by the HCR when EL2 is using AArch32, and by the HCR_EL2 when EL2 is using AArch64.
- The EL3 controls are provided by the SCR when EL3 is using AArch32, and by the SCR_EL3 when EL3 is using AArch64.

Therefore, most references to the HCR or SCR in this section are to entries in Table K13-1 on page K13-7390, that disambiguates between AArch32 registers and AArch64 registers. However, the Execution states used by EL2 and EL3 do affect some aspects of the routing and masking of the asynchronous exceptions, see *Asynchronous exception routing and masking with higher Exception levels using AArch64* on page G1-5279.

G1.15.1 Virtual exceptions when an implementation includes EL2

When implemented, EL2 provides the following virtual exceptions, that correspond to the physical asynchronous exceptions:

- Virtual SError, that corresponds to a physical external SError interrupt.
- Virtual IRQ, that corresponds to a physical IRQ.
- Virtual FIQ, that corresponds to a physical FIQ.

When the value of HCR.TGE is 0 and the value of an HCR.{AMO, IMO, FMO} routing control bit is 1, the corresponding virtual interrupt is enabled and a virtual exception is generated either:

- By setting the corresponding virtual interrupt pending bit, HCR.{VA, VI, VF}, to 1.
- For a Virtual IRQ or Virtual FIQ, by an IMPLEMENTATION DEFINED mechanism. This might be a signal from an interrupt controller. See, for example, the *ARM Generic Interrupt Controller Architecture Specification*.

When the value of HCR_EL2.TGE is 1 all virtual interrupts are disabled.

When a virtual interrupt is disabled:

- It cannot be taken.
- It cannot be seen in the ISR.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

In AArch32 state, a virtual exception is taken only from a Non-secure EL1 or EL0 mode. In any other mode, if the exception is generated it is not taken.

A virtual exception is taken in Non-secure state to the default mode for the corresponding physical exception. This means:

- A Virtual SError is taken to Non-secure Abort mode.
- A Virtual IRQ is taken to Non-secure IRQ mode.
- A Virtual FIQ is taken to Non-secure FIQ mode.

Table G1-15 summarizes the HCR bits that route asynchronous exceptions to EL2, and the bits that generate the virtual exceptions.

Table G1-15 HCR bits controlling asynchronous exceptions

Exception	Routing the physical exception to EL2	Generating the virtual exception
SError	HCR.AMO	HCR.VA
IRQ	HCR.IMO	HCR.VI
FIQ	HCR.FMO	HCR.VF

The HCR.{VA, VI, VF} bits generate a virtual exception only if set to 1 when the value of the corresponding HCR.{AMO, IMO, FMO} is 1.

Similarly, if the implementation also includes EL3, the HCR.{AMO, IMO, FMO} bits route the corresponding physical exception to Hyp mode only if the physical exception is not routed to Monitor mode by the SCR.{EA, IRQ, FIQ} bit. For more information, see *Asynchronous exception routing controls* on page G1-5276.

When the value of an HCR.{AMO, IMO, FMO} control bit is 1, the corresponding mask bit in PSTATE:

- Does not mask the physical exception.
- Masks the virtual exception when the PE is executing in a Non-secure EL1 or EL0 mode.

Taking a Virtual Abort exception clears HCR.VA to zero. Taking a Virtual IRQ exception or a Virtual FIQ exception does not affect the value of HCR.VI or HCR.VF.

Note

This means that the exception handler for a Virtual IRQ exception or a Virtual FIQ exception must cause software that is executing at EL2 or EL3 to update the HCR to clear the appropriate virtual exception bit to 0.

See *WFE wake-up events* on page G1-5310 and *Wait For Interrupt* on page G1-5311 for information about how virtual exceptions affect wake up from power-saving states.

Note

A hypervisor can use virtual exceptions to signal exceptions to the current Guest OS. The Guest OS takes a virtual exception exactly as it would take the corresponding physical exception, and is unaware of any distinction between virtual exception and the corresponding physical exception.

Effects of the HCR.{AMO, IMO, FMO} bits

As described in this section, the HCR.{AMO, IMO, FMO} bits are part of the mechanism for enabling the virtual exceptions. In addition, for exceptions generated in Non-secure state:

- As mentioned in this section, affect the routing of the exceptions. See *Asynchronous exception routing controls* on page G1-5276.
- Affect the masking of the exceptions. See *Asynchronous exception masking controls* on page G1-5277.

G1.15.2 Asynchronous exception routing controls

Note

This section describes the behavior when all Exception levels are using AArch32. For the differences when this is not the case see *Asynchronous exception routing and masking with higher Exception levels using AArch64* on page G1-5279.

In an implementation that includes EL3 the following bits in the SCR control the routing of asynchronous exceptions:

SCR.EA When the value of this bit is 1, any SError interrupt is taken to EL3.

Note

Although this section describes the asynchronous exception routing controls, SCR.EA also controls the routing of synchronous External aborts, see *Routing of aborts taken to AArch32 state* on page G1-5266.

SCR.FIQ When the value of this bit is 1, any FIQ exception is taken to EL3.

SCR.IRQ When the value of this bit is 1, any IRQ exception is taken to EL3.

When EL3 is using AArch32 and the value of one of the SCR.{EA, FIQ, IRQ} bits is 1, the exception is taken to Monitor mode.

Only Secure software can change the values of these bits.

In an implementation that includes EL2, the following bits in the HCR route asynchronous exceptions to EL2, for exceptions that are both:

- Taken from a Non-secure EL1 or EL0 mode.
- If the implementation also includes EL3, not configured, by the SCR.{EA, FIQ, IRQ} controls, to be taken to EL3.

HCR.AMO When the value of this bit is 1, an SError interrupt exception taken from a Non-secure EL1 or EL0 mode is taken to EL2, instead of to Non-secure Abort mode. If the implementation also includes EL3, this control applies only if the value of SCR.EA is 0. When the value of SCR.EA is 1, the value of the AMO bit is ignored.

HCR.FMO When the value of this bit is 1, an FIQ exception taken from a Non-secure EL1 or EL0 mode is taken to EL2, instead of to Non-secure FIQ mode. If the implementation also includes EL3, this control applies only if the value of SCR.FIQ is 0. When the value of SCR.FIQ is 1, the value of the FMO bit is ignored.

HCR.IMO When the value of this bit is 1, an IRQ exception taken from a Non-secure EL1 or EL0 mode is taken to EL2, instead of to Non-secure IRQ mode. If the implementation also includes EL3, this control applies only if the value of SCR.IRQ is 0. When the value of SCR.IRQ is 1, the value of the IMO bit is ignored.

When EL2 is using AArch32 and the value of one of the HCR.{AMO, FMO, IMO} bits is 1, the exception is taken to Hyp mode.

Only software executing in Hyp mode, or Secure software executing at EL3 with SCR.NS set to 1, can change the values of these bits. If EL3 is using AArch32, this requires the Secure software to be executing in Monitor mode.

The HCR.{AMO, FMO, IMO} bits also affect the masking of asynchronous exceptions in Non-secure state, as described in *Asynchronous exception masking controls* on page G1-5277.

The SCR.{EA, FIQ, IRQ} and HCR.{AMO, FMO, IMO} bits have no effect on the routing of Virtual Abort, Virtual FIQ, and Virtual IRQ exceptions.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Note

When the PE is in Hyp mode:

- Physical asynchronous exceptions that are not routed to Monitor mode are taken to Hyp mode.
- Virtual exceptions are not signaled to the PE.

See also *Asynchronous exception behavior for exceptions taken from AArch32 state* on page G1-5274.

G1.15.3 Asynchronous exception masking controls

Note

This section describes the behavior when all Exception levels are using AArch32. For the differences when this is not the case see *Asynchronous exception routing and masking with higher Exception levels using AArch64* on page G1-5279.

The PSTATE.{A, I, F} bits can mask the taking of the corresponding exceptions from AArch32 state, as follows:

- PSTATE.A can mask SError interrupt exceptions.
- PSTATE.I can mask IRQ exceptions.
- PSTATE.F can mask FIQ exceptions.

In an implementation that does not include either of EL2 and EL3, setting one of these bits to 1 masks the corresponding exception, meaning the exception cannot be taken.

In an implementation that includes EL2, the HCR.{AMO, IMO, FMO} bits modify the masking of exceptions taken from Non-secure state.

Similarly, in an implementation that includes EL3, the SCR.{AW, FW} bits modify the masking of exceptions taken from Non-secure state by the PSTATE.{A, F} bits.

An implementation that includes only EL1 and EL0 does not provide any masking of the PSTATE.{A, I, F} bits. The following subsections describe the masking of these bits in other implementations:

- *Asynchronous exception masking in an implementation that includes EL2 but not EL3*.
- *Asynchronous exception masking in an implementation that includes EL3 but not EL2*.
- *Asynchronous exception masking in an implementation that includes both EL2 and EL3* on page G1-5278.
- *Summary of the asynchronous exception masking controls* on page G1-5278.

Asynchronous exception masking in an implementation that includes EL2 but not EL3

The HCR.{AMO, IMO, FMO} bits modify the effect of the PSTATE.{A, I, F} bits. When the value of an HCR.{AMO, IMO, FMO} mask override bit is 1, the value of the corresponding PSTATE.{A, I, F} bit is ignored when the exception is taken from a Non-secure mode other than Hyp mode.

Asynchronous exception masking in an implementation that includes EL3 but not EL2

The SCR.{AW, FW} bits modify the effect of the PSTATE.{A, F} bits. When the value of one of the SCR.{AW, FW} bits is 0, the corresponding PSTATE bit is ignored when both of the follow apply:

- The corresponding exception is taken from Non-secure state.
- The value of the corresponding SCR.{EA, FIQ} bit is 1, routing the exception to EL3. This means the exception is routed to Monitor mode if EL3 is using AArch32.

Note

Whenever the value of PSTATE.I is 1, IRQ exceptions are masked and cannot be taken.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Asynchronous exception masking in an implementation that includes both EL2 and EL3

When the value of an HCR.{AMO, IMO, FMO} mask override bit is 1, the value of the corresponding PSTATE.{A, I, F} bit is ignored when both of the following apply:

- The exception is taken from Non-secure state.
- Either:
  - The corresponding SCR.{EA, IRQ, FIQ} bit routes the exception to Monitor mode.
  - The exception is taken from a Non-secure mode other than Hyp mode.

In addition, when the value of an SCR.{AW, FW} bit is 0, the value of the corresponding PSTATE.{A, F} bit is ignored when all of the following apply:

- The exception is taken from Non-secure state.
- The corresponding SCR.{EA, FIQ} bit routes the exception to Monitor mode.
- The corresponding HCR.{AMO, FMO} mask override bit is set to 0.

Summary of the asynchronous exception masking controls

The tables in this section show the masking controls for each of the PSTATE.{A, I, F} bits. For an implementation that does not include all of the Exception levels:

If the implementation includes only EL1 and EL0

The PSTATE bits cannot be masked. The behavior is as shown in the *Secure* row of the tables.

If the implementation includes EL2 but not EL3

The behavior is as shown in the *Non-secure* table rows when the control bits in the SCR are both 0.

If the implementation includes EL3 but not EL2

The behavior is as shown in the table rows where the control bit in the HCR is 0.

Table G1-16 shows the controls of the masking of SError interrupt exceptions by PSTATE.A.

Table G1-16 Control of masking by PSTATE.A

Security state	HCR.AMO	SCR.EA	SCR.AW	Mode	PSTATE.A
Secure	x	x	x	x	Masks SError interrupt, when set to 1
Non-secure	0	0	x	x	Masks SError interrupt, when set to 1
		1	0	x	Ignored
			1	x	Masks SError interrupt, when set to 1
	1	x	x	Not Hyp	Ignored
		0	x	Hyp	Masks SError interrupt, when set to 1
		1	x	x	Ignored

Non-Confidential

Table G1-17 shows the controls of the masking of IRQ exceptions by PSTATE.I:

Table G1-17 Control of masking by PSTATE.I

Security state	HCR.IMO	SCR.IRQ	Mode	PSTATE.I
Secure	x	x	x	Masks IRQs, when set to 1
Non-secure	0	x	x	Masks IRQs, when set to 1
	1	x	Not Hyp	Ignored
		0	Hyp	Masks IRQs, when set to 1
		1	x	Ignored

Table G1-18 shows the controls of the masking of FIQ exceptions by PSTATE.F:

Table G1-18 Control of masking by PSTATE.F

Security state	HCR.FMO	SCR.FIQ	SCR.FW	Mode	PSTATE.F
Secure	x	x	x	x	Masks FIQs, when set to 1
Non-secure	0	0	x	x	Masks FIQs, when set to 1
		1	0	x	Ignored
			1	x	Masks FIQs, when set to 1
	1	x	x	Not Hyp	Ignored
		0	x	Hyp	Masks FIQs, when set to 1
		1	x	x	Ignored

G1.15.4 Asynchronous exception routing and masking with higher Exception levels using AArch64

Asynchronous exception routing controls on page G1-5276 and *Asynchronous exception masking controls* on page G1-5277 give full descriptions of the routing and masking of the asynchronous exceptions when all Exception levels are using AArch32. However, when EL0 and EL1 are using AArch32:

- As already described, the SCR and HCR controls might be from Exception levels that are using AArch64.
- If EL3 is using AArch64, or EL2 is using AArch64, there are some changes to the asynchronous exception behaviors.

Therefore, the following sections summarize the asynchronous exception behaviors, taking account of the Execution state being used at EL2 and EL3:

- *Summary of physical interrupt routing*.
- *Summary of physical interrupt masking* on page G1-5280.

Summary of physical interrupt routing

The Table G1-19 on page G1-5280 shows the routing of physical FIQ, IRQ and SError interrupts when the highest Exception level is using AArch32. If the highest Exception level is using AArch64, see Table D1-12 on page D1-2187.

In this table:

SCR This is the *Effective value* of a field in SCR.

HCR This is the *Effective value* of a field in HCR.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

FIQ IRQ EA The *Effective value* of the field that handles the asynchronous exception type in SCR.

FMO IMO AMO The *Effective value* of the mask override field for the asynchronous exception type in HCR, if EL2 is using AArch32 or HCR_EL2 if EL2 is using AArch64.

FIQ IRQ Abt The exception is taken to the FIQ mode, the IRQ mode or the Abort mode according to the type of asynchronous exception.

Hyp The exception is taken to AArch32 Hyp mode.

Mon The exception is taken to AArch32 Monitor mode.

n/a This field does not exist, or the Exception level is not accessible in this configuration.

Table G1-19 Routing of physical FIQ exceptions

Control bits							
SCR		HCR		Target when taken from EL0	Target when taken from EL1	Target when taken from EL2	Target when taken from EL3
NS	FIQ IRQ EA	TGE	FMO IMO AMO				
0	x	x	x	FIQ IRQ Abt	n/a	n/a	FIQ IRQ Abt
1	0	0	0	FIQ IRQ Abt	FIQ IRQ Abt	Hyp	FIQ IRQ Abt
			1	Hyp	Hyp	Hyp	FIQ IRQ Abt
		1	x	Hyp	n/a	Hyp	FIQ IRQ Abt
	1	0	x	Mon	Mon	Mon	Mon
		1	x	Mon	n/a	Mon	Mon

Summary of physical interrupt masking

Table G1-20 on page G1-5281 shows the masking of physical FIQ, IRQ and SError interrupts when the highest Exception level is using AArch32. When the highest Exception level is using AArch64, see Table D1-15 on page D1-2191.

In this table:

SCR This is the *Effective value* of a field in SCR.

HCR This is the *Effective value* of a field in HCR.

FIQ IRQ EA The *Effective value* of the field that handles the asynchronous exception type in SCR.

FMO IMO AMO The *Effective value* of the mask override field for the asynchronous exception type in HCR, if EL2 is using AArch32 or HCR_EL2 if EL2 is using AArch64.

FW AW For FIQ interrupts, the SCR.FW field, and for SError interrupts, the SCR.AW field. For IRQ interrupts, there is no equivalent field, so the *Effective value* is 0 and rows where this cell is 1 should be ignored.

A When the interrupt is asserted, it is taken regardless of the value of the PSTATE mask bit. The target Exception level might be using AArch64 or AArch32.

B When the interrupt is asserted, it is subject to the corresponding PSTATE mask bit. If the value of the mask is 1, the interrupt is not taken. If the value of the mask is 0, the interrupt is taken.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

n/a This field does not exist, or the Exception level is not accessible in this configuration.

Table G1-20 Masking of physical FIQ exceptions

Control bits					Effect of the interrupt mask when executing at:			
SCR			HCR					
NS	FW AW	FIQ IRQ EA	TGE	FMO IMO AMO	EL0	EL1	EL2	EL3
0	x	x	x	x	B	n/a	n/a	B
1	x	0	0	0	B	B	B	B
				1	A	A	B	B
			1	x	A	n/a	B	B
	0	1	0	x	A	A	A	A
			1	x	A	n/a	A	A
	1	x	0	0	A	A	B	B
				1	A	A	A	A
			1	x	A	n/a	A	A

G1.15.5 Taking an interrupt or other exception during a multiple-register load or store

In AArch32 state, an interrupt cannot be taken during a sequence of memory accesses caused by a single load or store instruction, except that when ARMv8.2-LSMAOC is implemented and the value of the applicable LSMAOE field is 0, an interrupt can be taken between two memory accesses made by a single AArch32 Load Multiple (`LDM`) or Store Multiple (`STM`) instruction.

The applicable LSMAOE field is the field in the SCTLR_EL1, SCTLR_EL2, HSCTLR, or SCTLR register that applies to the Exception level and Security state at which the `LDM` or `STM` instruction is executed.

When the value of the LSMAOE bit is 0 and an interrupt is taken between two memory accesses made by a single AArch32 `LDM` or `STM` instruction, then:

- For a load, any register being loaded by the instruction other than a register used in the generation of the address by the instruction or the PC, can contain an UNKNOWN value. Any register used in the generation of the address is restored to its initial value and the LR is set on the interrupt to a value consistent with returning to the instruction.
- For a store, any data location being stored to by the instruction can contain an UNKNOWN value.
- For either a load or store, if the instruction specifies writeback of the base address, then that register is restored to its initial value.

ARMv8.2 deprecates software relying on interrupts not being taken during the sequence of memory accesses caused by a single load or store instruction.

G1.16 AArch32 state exception descriptions

Handling exceptions that are taken to an Exception level using AArch32 on page G1-5247 gives general information about exception handling. This section describes each of the exceptions, in the following subsections:

- *Undefined Instruction exception*.
- *Monitor Trap exception* on page G1-5284.
- *Hyp Trap exception* on page G1-5285.
- *Supervisor Call (SVC) exception* on page G1-5286.
- *Secure Monitor Call (SMC) exception* on page G1-5287.
- *Hypervisor Call (HVC) exception* on page G1-5288.
- *Prefetch Abort exception* on page G1-5289.
- *Data Abort exception* on page G1-5293.
- *Virtual SError interrupt exception* on page G1-5297.
- *IRQ exception* on page G1-5298.
- *Virtual IRQ exception* on page G1-5300.
- *FIQ exception* on page G1-5300.
- *Virtual FIQ exception* on page G1-5302.

Additional pseudocode functions for exception handling on page G1-5302 gives additional pseudocode that is used in the pseudocode descriptions of a number of the exceptions.

G1.16.1 Undefined Instruction exception

An Undefined Instruction exception might be caused by:

- A System register access, floating-point, or Advanced SIMD instruction that is not accessible because of the settings in one or more of the CPACR, NSACR, HCPTR, and DBGDSCRext.
- A System register access, floating-point, or Advanced SIMD instruction that is not implemented.
- A System register access, floating-point, or Advanced SIMD instruction that causes an exception during execution. This includes:
  - Trapped floating-point exceptions that are taken to AArch32, if an implementation supports these traps. See *Floating-point exceptions and exception traps* on page E1-3551.
  - Execution of certain floating-point instructions when one or both of the FPSCR.{Stride, Len} fields in nonzero, in an implementation in which those fields are RW. The description of FPEXC specifies the instructions to which this applies.
- An instruction that is UNDEFINED.

Note

The Undefined Instruction exception is taken using offset `0x04` in the Hyp, Secure, or Non-secure vector table. In the Monitor vector table this offset is used for the Monitor Trap exception. See *Monitor Trap exception* on page G1-5284 and *The vector tables and exception offsets* on page G1-5248.

By default, an Undefined Instruction exception is taken to Undefined mode, but an Undefined Instruction exception can be taken to EL2, meaning it is taken to Hyp mode if EL2 is using AArch32, see *The PE mode to which the Undefined Instruction exception is taken* on page G1-5283.

The Undefined Instruction exception can provide:

- Signaling of an illegal instruction execution.
- *Lazy context switching* of System registers.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

The preferred return address for an Undefined Instruction exception is the address of the instruction that generated the exception. For an exception taken to AArch32 state, this return is performed as follows:

- If returning from Secure or Non-secure Undefined mode, the exception return uses the SPSR and LR_und values generated by the exception entry, as follows:
  - If SPSR.T is 0, indicating that the exception occurred in A32 state, the return uses an exception return instruction with a subtraction of 4.
  - If SPSR.T is 1, indicating that the exception occurred in T32 state, the return uses an exception return instruction with a subtraction of 2.
- If returning from Hyp mode, the exception return is performed by an `ERET` instruction, using the SPSR and ELR_hyp values generated by the exception entry.

For more information, see *Exception return to an Exception level using AArch32* on page G1-5269.

Note

If handling the Undefined Instruction exception requires instruction emulation, followed by return to the next instruction after the instruction that caused the exception, the instruction emulator must use the instruction length to calculate the correct return address, and to calculate the updated values of the IT bits if necessary.

The PE mode to which the Undefined Instruction exception is taken

Figure G1-4 shows how the implementation, state, and configuration options determine the PE mode to which an Undefined Instruction exception is taken, when the exception is taken to an Exception level that is using AArch32.

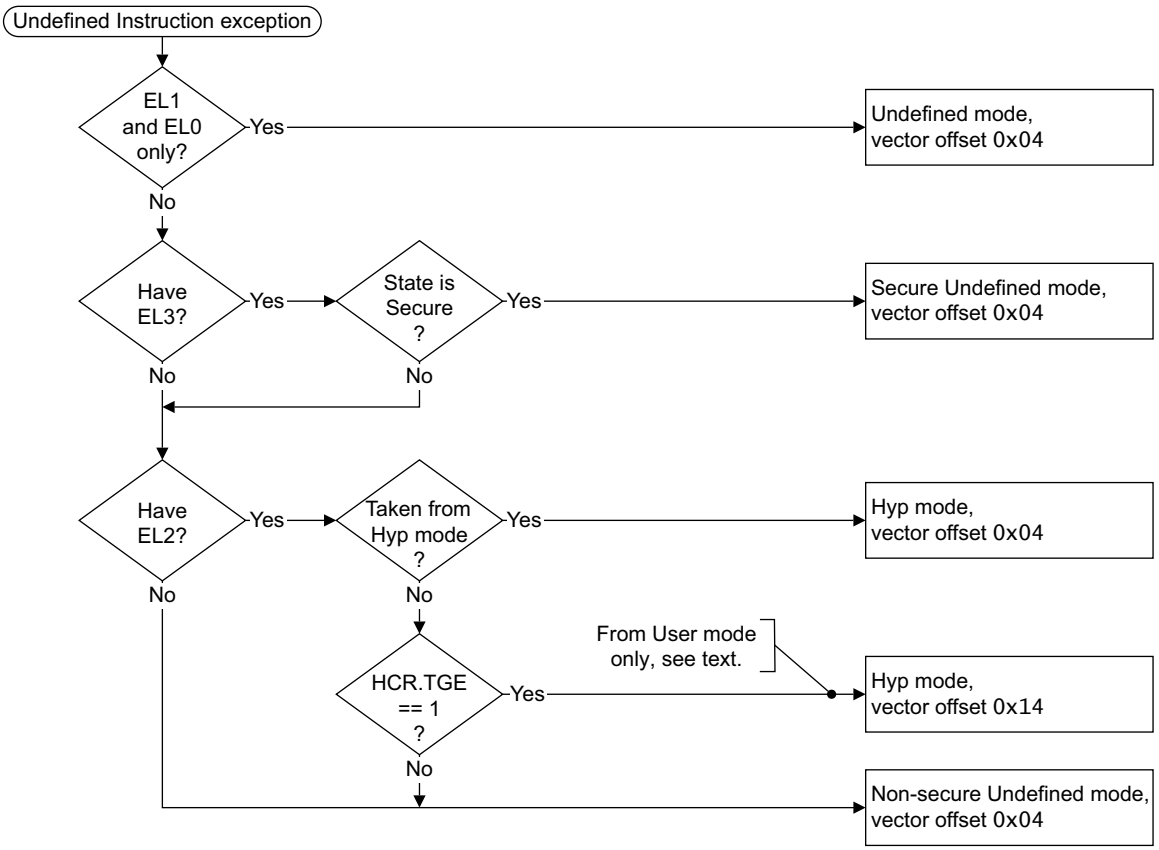

Figure G1-4 The PE mode an Undefined Instruction exception is taken to in AArch32 state

See also *UNPREDICTABLE cases when the value of HCR.TGE is 1* on page G1-5260.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Pseudocode description of taking the Undefined Instruction exception

The `AArch32.UndefinedFault()` pseudocode procedure determines whether the Undefined Instruction exception is taken to AArch32 state. If it is taken to AArch32 state, the `AArch32.TakeUndefInstrException()` pseudocode procedure describes how the PE takes the exception.

An Undefined Instruction exception is taken to an Exception level using AArch64 if either:

- It is generated in User mode when EL1 is using AArch64.
- It is generated in User mode when EL2 is enabled in the current Security state and is using AArch64 and the value of HCR_EL2.TGE is 1.

Conditional execution of undefined instructions

The conditional execution rules described in *Conditional execution* on page F2-3661 apply to all instructions. This includes undefined instructions and other instructions that would cause entry to the Undefined Instruction exception.

If such an instruction fails its condition check, the behavior depends on the potential cause of entry to the Undefined Instruction exception, as follows:

- If the potential cause is the execution of the instruction itself and depends on data values used by the instruction, the instruction executes as a `NOP` and does not cause an Undefined Instruction exception.
- In the following cases, it is IMPLEMENTATION DEFINED whether the instruction executes as a `NOP` or causes an Undefined Instruction exception:
  - The potential cause is the execution of an earlier System register access instruction, floating-point instruction, or Advanced SIMD instruction.
  - The potential cause is the execution of the instruction itself without dependence on the data values used by the instruction.

  An implementation must handle all such cases in the same way.

Note

Before ARMv7, all implementations executed any instruction that failed its condition check as a `NOP`, even if it would otherwise have caused an Undefined Instruction exception. An Undefined Instruction handler written for these implementations might assume without checking that the undefined instruction passed its condition check. Such an Undefined Instruction handler is likely to need rewriting, to check the condition is passed, before it functions correctly on all AArch32 implementations.

Interaction of UNDEFINED instruction behavior with UNPREDICTABLE or CONSTRAINED UNPREDICTABLE instruction behavior

If this manual describes an instruction as both:

- UNPREDICTABLE and UNDEFINED then the instruction is UNPREDICTABLE.
- CONSTRAINED UNPREDICTABLE and UNDEFINED then the instruction is CONSTRAINED UNPREDICTABLE.

Note

An example of this is where both:

- An instruction, or instruction class, is made UNDEFINED by some general principle, or by a configuration field.
- A particular encoding of that instruction or instruction class is specified as CONSTRAINED UNPREDICTABLE.

G1.16.2 Monitor Trap exception

The Monitor Trap exception is implemented only as part of EL3, and can be generated only if EL3 is using AArch32.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Note

The Monitor Trap exception is taken using offset `0x04` in the Monitor vector table. In the other vector tables, this offset is used for the Undefined Instruction exception. See *Undefined Instruction exception* on page G1-5282 and *The vector tables and exception offsets* on page G1-5248.

A Monitor Trap exception is generated if the PE is running in a mode other than Monitor mode, and commits for execution a `WFI` or `WFE` instruction that would otherwise cause suspension of execution when:

- In the case of the `WFI` instruction, the value of the SCR.TWI bit is 1.
- In the case of the `WFE` instruction, the value of the SCR.TWE bit is 1.

Note

Since a `WFE` or `WFI` can complete at any time, even without a Wakeup event, the traps on `WFE` of `WFI` are not guaranteed to be taken, even if the `WFE` or `WFI` is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The preferred return address for a Monitor Trap exception is the address of the instruction that generated the exception. The exception return uses the SPSR and LR_mon values generated by the exception entry, as follows:

- If SPSR.T is 0, indicating that the exception occurred in A32 state, the return uses an exception return instruction with a subtraction of 4.
- If SPSR.T is 1, indicating that the exception occurred in T32 state, the return uses an exception return instruction with a subtraction of 2.

For more information, see *Exception return to an Exception level using AArch32* on page G1-5269.

The PE mode to which the Monitor Trap exception is taken

When EL3 is using AArch32, a Monitor Trap exception is taken to Monitor mode, using a vector offset of `0x04` from the Monitor exception base address.

Pseudocode description of taking the Monitor Trap exception

The `AArch32.TakeMonitorTrapException()` pseudocode procedure describes how the PE takes the exception.

G1.16.3 Hyp Trap exception

The Hyp Trap exception provides the standard mechanism for trapping Guest OS functions to the hypervisor.

The Hyp Trap exception is implemented only as part of EL2 and can be generated only if EL2 is using AArch32.

A Hyp Trap exception is generated if the PE is running in a Non-secure mode other than Hyp mode, and commits for execution an instruction that is trapped to Hyp mode. Instruction traps are enabled by setting bits to 1 in the HCR, HCPTR, HDCR, or HSTR. For more information see *EL2 configurable controls* on page G1-5331.

Traps to Hyp mode never apply in Secure state, regardless of the value of the SCR.NS bit.

The preferred return address for a Hyp Trap exception is the address of the trapped instruction. The exception return is performed by an `ERET` instruction, using the SPSR and ELR_hyp values generated by the exception entry.

Note

The SPSR and ELR_hyp values generated on exception entry can be used, without modification, for an exception return to re-execute the trapped instruction. If the exception handler emulates the trapped instruction, and must return to the following instruction, the emulation of the instruction must include modifying ELR_hyp, and possibly updating SPSR_hyp.

When the PE enters the handler for a Hyp Trap exception, the HSR holds syndrome information for the exception. For more information see *Use of the HSR* on page G5-5580.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

The PE mode to which the Hyp Trap exception is taken

A Hyp Trap exception is taken to Hyp mode, using a vector offset of `0x14` from the Hyp exception base address.

Pseudocode description of taking the Hyp Trap exception

The `AArch32.TakeHypTrapException()` pseudocode procedure describes how the PE takes the exception.

G1.16.4 Supervisor Call (SVC) exception

The Supervisor Call instruction, `SVC`, requests a supervisor function, typically to request an operating system function. When EL1 is using AArch32, executing an `SVC` instruction causes the PE to enter Supervisor mode. For more information, see *SVC* on page F5-4419.

Note

In an implementation that includes EL2, when EL2 is using AArch32:

- When an `SVC` instruction is executed in Hyp mode, the Supervisor Call exception is taken to Hyp mode. For more information see *SVC* on page F5-4419.
- When the HCR.TGE bit is set to 1, the Supervisor Call exception generated by execution of an `SVC` instruction in Non-secure User mode is routed to Hyp mode. For more information, see *Supervisor Call exception, when the value of HCR.TGE is 1* on page G1-5263.

By default, a Supervisor Call exception that is taken to AArch32 state is taken to Supervisor mode, but a Supervisor Call exception can be taken to EL2, meaning it is taken to Hyp mode if EL2 is using AArch32, see *The PE mode to which the Supervisor Call exception is taken*.

The preferred return address for a Supervisor Call exception is the address of the next instruction after the `SVC` instruction. For an exception taken to AArch32 state, this return is performed as follows:

- If returning from Secure or Non-secure Supervisor mode, the exception return uses the SPSR and LR_svc values generated by the exception entry, in an exception return instruction without subtraction.
- If returning from Hyp mode, the exception return is performed by an `ERET` instruction, using the SPSR and ELR_hyp values generated by the exception entry.

For more information, see *Exception return to an Exception level using AArch32* on page G1-5269.

The PE mode to which the Supervisor Call exception is taken

Figure G1-5 on page G1-5287 shows how the implementation, state, and configuration options determine the PE mode to which a Supervisor Call exception is taken, when the exception is taken to an Exception level that is using AArch32.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

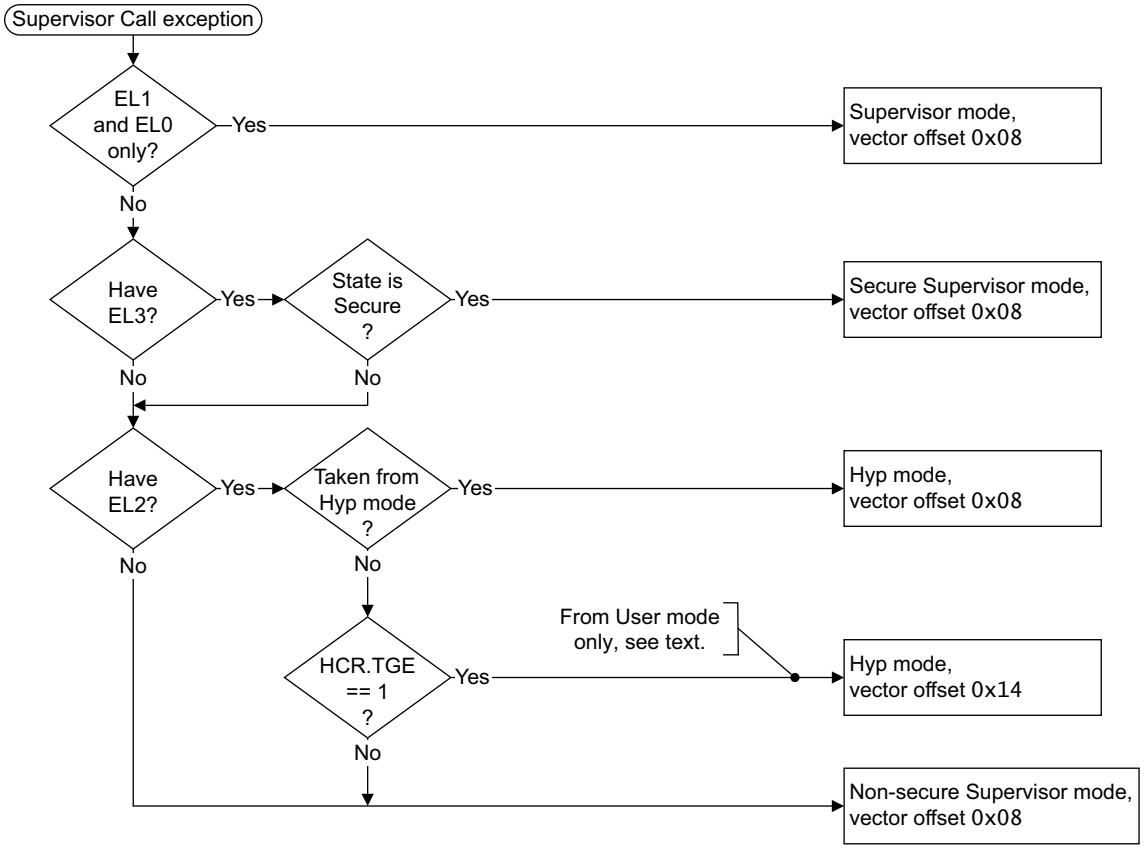

Figure G1-5 The PE mode the Supervisor Call exception is taken to in AArch32 state

See also *UNPREDICTABLE cases when the value of HCR.TGE is 1* on page G1-5260.

Pseudocode description of taking the Supervisor Call exception

The `AArch32.CallSupervisor()` pseudocode procedure determines whether the Supervisor Call exception is taken to AArch32 state. If it is taken to AArch32 state, the `AArch32.TakeSVCException()` pseudocode procedure describes how the PE takes the exception.

An Supervisor Call exception is taken to an Exception level using AArch64 if either:

- It is generated by executing an `SVC` instruction in User mode when EL1 is using AArch64.
- It is generated by executing an `SVC` instruction in Non-secure User mode when EL2 is using AArch64 and the value of HCR_EL2.TGE is 1.

G1.16.5 Secure Monitor Call (SMC) exception

The Secure Monitor Call exception is implemented only as part of EL3. When EL3 is using AArch32, the exception is taken to Monitor mode.

The Secure Monitor Call instruction, `SMC`, requests a Secure Monitor function. When EL3 is using AArch32, executing an `SMC` instruction causes the PE to enter Monitor mode. For more information, see *SMC* on page F5-4266.

Note

- In an implementation that includes EL2, execution of an `SMC` instruction in a Non-secure EL1 mode can be trapped to EL2. When EL2 is using AArch32, this means that when HCR.TSC 1, execution of an `SMC` instruction in a Non-secure EL1 mode generates a Hyp Trap Exception that is taken to Hyp mode. For more information see *Traps to Hyp mode of Non-secure EL1 execution of SMC instructions* on page G1-5338.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

- The Operation pseudocode in the description of the AArch32 SMC instruction, in *SMC* on page F5-4266, identifies cases where execution of the instruction generates an exception that is taken to EL3 using AArch64.

The preferred return address for a Secure Monitor Call exception is the address of the next instruction after the SMC instruction. For an exception taken to AArch32 state, this return is performed using the SPSR and LR_mon values generated by the exception entry, using an exception return instruction without a subtraction.

For more information, see *Exception return to an Exception level using AArch32* on page G1-5269.

Note

For an exception taken to AArch32 state, the exception handler can return to the SMC instruction itself by returning using a subtraction of 4, without any adjustment to the SPSR.IT[7:0] bits. If it does this, the return occurs, then asynchronous exceptions might occur and be handled, then the SMC instruction is re-executed and another Secure Monitor Call exception occurs.

This relies on:

- The SMC instruction being used correctly, either outside an IT block or as the last instruction in an IT block, so that the SPSR.IT[7:0] bits indicate unconditional execution.
- The Secure Monitor Call handler not changing the result of the original conditional execution test for the SMC instruction.

The PE mode to which the Secure Monitor Call exception is taken

The Secure Monitor Call exception is supported only as part of EL3. When EL3 is using AArch32, a Secure Monitor Call exception is taken to Monitor mode, using vector offset 0x08 from the Monitor exception base address.

Note

- An SMC instruction that is trapped to Hyp mode because HCR.TSC is set to 1 generates a Hyp Trap exception, see *The PE mode to which the Hyp Trap exception is taken* on page G1-5286.
- If EL3 is using AArch64 then *Security behavior in Exception levels using AArch32 when EL2 or EL3 are using AArch64* on page G1-5258 describes the effect of executing an SMC instruction at an Exception level that is using EL1.

Pseudocode description of taking the Secure Monitor Call exception

The `AArch32.TakeSMCException()` pseudocode procedure describes how the PE takes the exception when the exception is taken to an Exception level that is using AArch32.

G1.16.6 Hypervisor Call (HVC) exception

The Hypervisor Call exception is implemented only as part of EL2.

The Hypervisor Call instruction, HVC, requests a hypervisor function. When EL2 is using AArch32, executing an HVC instruction generates a Hypervisor Call exception that is taken to Hyp mode. For more information, see *HVC* on page F5-3949.

Note

- Execution of HVC instructions is disabled when the value of SCR.HCE is 0. Descriptions of HVC instruction execution elsewhere in this section assume the *Effective value* of SCR.HCE is 1.
- When EL2 is using AArch64 an HVC instruction executed in a Non-secure EL1 mode generates an exception that is taken to EL2 using AArch64. *Exception classes and the ESR_ELx syndrome registers* on page D1-2160 describes how this exception is reported in ESR_EL2.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

The preferred return address for a Hypervisor Call exception is the address of the next instruction after the HVC instruction. The exception return is performed by an ERET instruction, using the SPSR and ELR_hyp values generated by the exception entry.

For more information, see *Exception return to an Exception level using AArch32* on page G1-5269.

When EL2 is using AArch32, executing an HVC instruction transfers the immediate argument of the instruction to the HSR. The exception handler retrieves the argument from the HSR, and therefore does not have to access the original HVC instruction. For more information see *Use of the HSR* on page G5-5580.

The PE mode to which the Hypervisor Call exception is taken

The Hypervisor Call exception is supported only as part of EL2. When EL2 is using AArch32, a Hypervisor Call exception is taken to Hyp mode, using a vector offset that depends on the mode from which the exception is taken, as Figure G1-6 shows. This offset is from the Hyp exception base address.

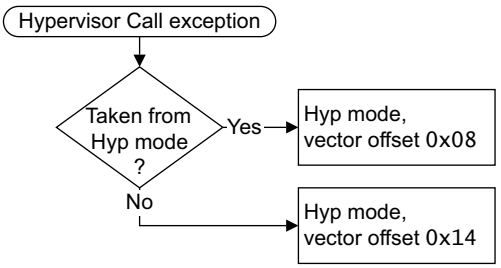

Figure G1-6 The PE mode the Hypervisor Call exception is taken to in AArch32 state

Pseudocode description of taking the Hypervisor Call exception

The AArch32.CallHypervisor() pseudocode procedure determines whether the valid execution of an HVC instruction in AArch32 state generates an exception that is taken to EL2 using AArch64, or generates a Hypervisor Call exception taken to Hyp mode. The AArch32.TakeHVCException() pseudocode procedure describes how the PE takes a Hypervisor Call exception.

G1.16.7 Prefetch Abort exception

A Prefetch Abort exception can be generated by:

- A synchronous memory abort on an instruction fetch.

  Note

  Asynchronous External aborts on instruction fetches are reported as SError interrupts using the Data Abort exception, see *Data Abort exception* on page G1-5293.

  A Prefetch Abort exception entry is synchronous to the instruction whose fetch aborted.

  For more information about memory aborts see *VMSAv8-32 memory aborts* on page G5-5554.

- A Breakpoint, Vector Catch or Breakpoint Instruction exception, see Chapter G2 *AArch32 Self-hosted Debug*.

Note

If an implementation fetches instructions speculatively, it must handle a synchronous abort on such an instruction fetch by:

- Generating a Prefetch Abort exception only if the instruction would be executed in a simple sequential execution of the program.
- Ignoring the abort if the instruction would not be executed in a simple sequential execution of the program.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

By default, when EL1 is using AArch32, a Prefetch Abort exception is taken to Abort mode, but a Prefetch Abort exception can be taken to:

- EL2, meaning it is taken to Hyp mode if EL2 is using AArch32.
- EL3, meaning it is taken to Monitor mode if EL3 is using AArch32.

For more information:

- About cases where the Prefetch Abort exception is taken to an Exception level that is using AArch32, see *The PE mode to which the Prefetch Abort exception is taken* on page G1-5291.
- About cases where the Prefetch Abort generates an exception that is taken to an Exception level that is using AArch64, see *Pseudocode description of taking the Prefetch Abort exception* on page G1-5293.

The preferred return address for a Prefetch Abort exception is the address of the aborted instruction. For an exception taken to AArch32 state this return is performed as follows:

- If returning from a mode other than Hyp mode, using the SPSR and LR values generated by the exception entry, using an exception return instruction with a subtraction of 4. This means using:
  - SPSR_abt and LR_abt if returning from Abort mode.
  - SPSR_mon and LR_mon if returning from Monitor mode.
- If returning from Hyp mode, using the SPSR_hyp and ELR_hyp values generated by the exception entry, using an `ERET` instruction.

For more information about the handling of Prefetch Abort exceptions in AArch32 state see *Exception return to an Exception level using AArch32* on page G1-5269.

Prefetch Abort exception reporting a PC alignment fault exception

A PC alignment fault exception that is taken to an Exception level that is using AArch32 is reported as a Prefetch Abort exception, and:

If the exception is taken to EL1 using AArch32 or EL3 using AArch32

- The IFSR indicates the cause of the exception:
  - If the value of TTBCR.EAE is 0, IFSR.FS takes the value `0b00001`.
  - If the value of TTBCR.EAE is 1, IFSR.STATUS takes the value `0b100001`.
- IFAR holds the value of the address that faulted, including the misaligned low order bit or bits.
- R14_abt holds the address that faulted, including the misaligned low order bit or bits, with the standard offset for a Prefetch Abort exception.

If the exception is taken to EL2 using AArch32

- HSR.EC takes the value `0b100010`.
- HSR.IL is UNKNOWN.
- HSR.ISS is RES0.
- HIFAR and ELR_hyp each hold the value of the address that faulted, including the misaligned low order bit or bits.

For a PC alignment fault exception taken to an Exception level that is using AArch32:

- If the exception occurred because of the CONSTRAINED UNPREDICTABLE behavior of a branch to an unaligned PC value, as described in *Branching to an unaligned PC* on page K1-7192, then bit[0] of the faulting address is forced to zero, and therefore the misalignment is because the value of bit[1] of this address is 1.
- If the exception occurred on an exit from Debug state, as described in *Exiting Debug state* on page H2-6454, then it is CONSTRAINED UNPREDICTABLE whether bit[0] of the faulting address is forced to zero.

Pseudocode description of taking the Prefetch Abort exception

The `AArch32.Abort()` pseudocode function determines whether the Prefetch Abort condition generates an exception that is taken to an Exception level that is using AArch64, or generates a Prefetch Abort exception that is taken in AArch32 state. When the exception is taken in AArch32 state, the `AArch32.TakePrefetchAbortException()` pseudocode procedure describes how the PE takes the exception.

The exception is taken to an Exception level using AArch64 if one of the following applies:

- The exception is generated in User mode when EL1 is using AArch64.
- The implementation includes EL2, EL2 is using AArch64, and one of the following applies:
  - The value of HCR_EL2.TGE is 1 and the exception is generated in Non-secure User mode.
  - The value of MDCR_EL2.TDE is 1 and the exception is generated by a Debug exception in a Non-secure EL1 or Non-secure EL0 mode.
  - The exception is generated by a stage 2 fault during a stage 1 translation table walk using the AArch32 Non-secure EL1&0 translation regime.
- The implementation includes EL3, EL3 is using AArch64, the value of SCR_EL3.EA is 1. and the exception is generated by an External abort in AArch32 state.

G1.16.8 Data Abort exception

In AArch32 state, a Data Abort exception can be generated by:

- A synchronous abort on a data read or write memory access. Exception entry is synchronous to the instruction that generated the memory access.
- An SError interrupt. The SError interrupt might be caused by an External abort on a memory access, which can be any of:
  - A data read or write access.
  - An instruction fetch.
  - In a VMSA memory system, a translation table access.

  Exception entry occurs asynchronously.

  As described in *Asynchronous exception masking controls* on page G1-5277, SError interrupts can be masked. When this happens, a generated SError interrupt is not taken until it is not masked.
- A watchpoint, see *Watchpoint exceptions* on page G2-5399.

By default, when EL1 is using AArch32 a Data Abort exception is taken to Abort mode, but a Data Abort exception can be taken to:

- EL2, meaning it is taken to Hyp mode if EL2 is using AArch32.
- EL3, meaning it is taken to Monitor mode if EL3 is using AArch32.

For more information:

- About cases where the Data Abort exception is taken to an Exception level that is using AArch32 see *The PE mode to which the Data Abort exception is taken* on page G1-5294.
- About memory aborts in AArch32 state see *VMSAv8-32 memory aborts* on page G5-5554.
- About cases where the Data Abort generates an exception that is taken to an Exception level that is using AArch64 see *Pseudocode description of taking the Data Abort exception* on page G1-5296.

The preferred return address for a Data Abort exception is the address of the instruction that generated the aborting memory access, or the address of the instruction following the instruction boundary at which an SError interrupt exception was taken. For an exception taken to AArch32 state, this return is performed as follows:

- If returning from a mode other than Hyp mode, using the SPSR and LR values generated by the exception entry, using an exception return instruction with a subtraction of 8. This means using:
  - SPSR_abt and LR_abt if returning from Abort mode.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

  - SPSR_mon and LR_mon if returning from Monitor mode.

- If returning from Hyp mode, using the SPSR_hyp and ELR_hyp values generated by the exception entry, using an `ERET` instruction.

For more information about the handling of Data Abort exceptions in AArch32 state see *Exception return to an Exception level using AArch32* on page G1-5269.

The PE mode to which the Data Abort exception is taken

Figure G1-8 on page G1-5295 shows the determination of the mode to which a Data Abort exception is taken when the exception is taken to an Exception level that is using AArch32.

Note

In this figure, the Effective value of HCR2.TEA is 0 if the RAS Extension is not implemented.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

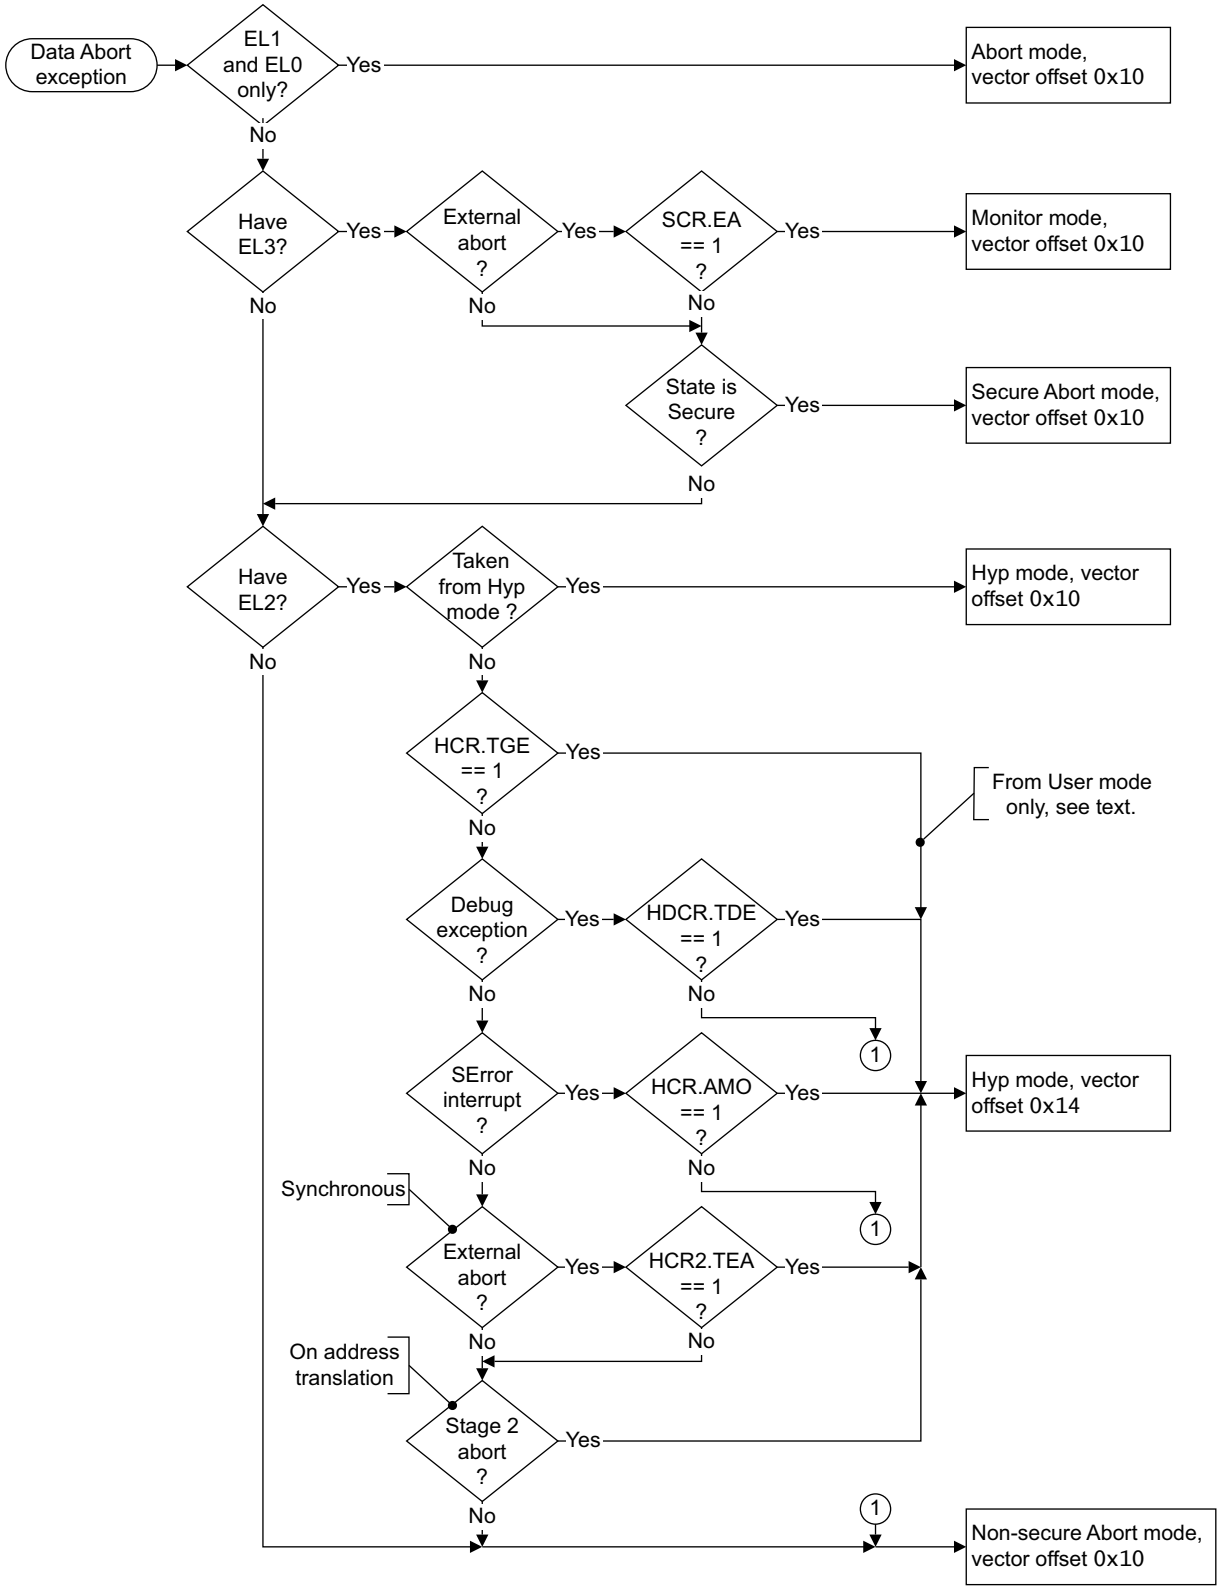

Figure G1-8 The PE mode the Data Abort exception is taken to in AArch32 state

See also *UNPREDICTABLE cases when the value of HCR.TGE is 1* on page G1-5260.

Pseudocode description of taking the Data Abort exception

The `AArch32.Abort()` pseudocode function determines whether the Data Abort condition generates an exception that is taken to an Exception level that is using AArch64, or generates a Data Abort exception that is taken in AArch32 state. When the exception is taken in AArch32 state, the `AArch32.TakeDataAbortException()` pseudocode procedure describes how the PE takes the exception.

The exception is taken to an Exception level using AArch64 if one of the following applies:

- The exception is generated in User mode when EL1 is using AArch64.
- The implementation includes EL2, EL2 is using AArch64, and one of the following applies:
  - The value of HCR_EL2.TGE is 1 and the exception is generated in Non-secure User mode.
  - The value of MDCR_EL2.TDE is 1 and the exception is generated by a Debug exception in a Non-secure EL1 or Non-secure EL0 mode.
  - The exception is generated by a stage 2 fault during a stage 1 translation table walk using the AArch32 Non-secure EL1&0 translation regime.
- The implementation includes EL3, EL3 is using AArch64, the value of SCR_EL3.EA is 1. and the exception is generated by an External abort in AArch32 state.

Effects of data-aborted instructions

An instruction that accesses data memory can modify memory by storing one or more values. If the execution of such an instruction generates a Data Abort exception, or causes Debug state entry because of a watchpoint set on the instruction, the value of each memory location that the instruction stores to is:

- Unchanged for any location for which one of the following applies:
  - An Alignment fault is generated.
  - An MMU fault is generated.
  - A Watchpoint is generated.
  - An External abort is generated, if that External abort is taken synchronously.
- UNKNOWN for any location for which no exception and no debug event is generated.

If the access to a memory location generates an External abort that is taken asynchronously, it is outside the scope of the architecture to define the effect of the store on that memory location, because this depends on the system-specific nature of the External abort. However, in general, ARM recommends that such locations are unchanged.

For External aborts and Watchpoints, where in principle faulting could be identified at byte or halfword granularity, the size of a location in this definition is the size for which a memory access is single-copy atomic.

In AArch32 state, instructions that access data memory can modify registers in the following ways:

- By loading values into one or more of the general-purpose registers. The registers loaded can include the PC.
- By loading values into one or more of the registers in the Advanced SIMD and floating-point register file.
- By specifying *base register writeback*, in which the base register used in the address calculation has a modified value written to it. All instructions that support base register writeback have CONSTRAINED UNPREDICTABLE results if base register writeback is specified with the PC as the base register. Only general-purpose registers can be modified reliably in this way.
- By a direct transfer to or from the Debug Communication Channel (DCC) register, using the LDC and STC instructions. For more information see Chapter H4 *The Debug Communication Channel and Instruction Transfer Register*.

  If the instruction that accesses the DCC registers is an LDC or STC instruction, UNKNOWN values are left in the Data Transfer Register and DCC flow-control flags.
- By modifying PSTATE.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

If the execution of such an instruction generates a synchronous Data Abort exception, the following rules determine the values left in these registers:

- On entry to the Data Abort exception handler:
  - The PC value is the Data Abort vector address, see *Exception vectors and the exception base address on page G1-5247*.
  - The LR_abt value is determined from the address of the aborted instruction.

  Neither value is affected by the results of any load specified by the instruction.
- The base register is restored to its original value if either:
  - The aborted instruction is a load and the list of registers to be loaded includes the base register.
  - The base register is being written back.
- If the instruction only loads one general-purpose register the value in that register is unchanged.
- If the instruction loads more than one general-purpose register, UNKNOWN values are left in destination registers other than the PC and the base register of the instruction.
- If the instruction affects any registers in the Advanced SIMD and floating-point register file, UNKNOWN values are left in the registers that are affected.
- PSTATE bits that are not defined as updated on exception entry retain their current value.
- If the instruction is a `STREX`, `STREXB`, `STREXH`, or `STREXD`, `<Rd>` is not updated.

After taking a Data Abort exception, the state of the Exclusives monitors is UNKNOWN. Therefore, ARM strongly recommends that the abort handler performs a `CLREX` instruction, or a dummy `STREX` instruction, to clear the Exclusives monitor state.

An External abort might signal a data corruption to the PE. For example a memory location might have been corrupted. The error that caused the External abort might have been propagated. The RAS Extension provides mechanisms for software to determine the extent of the corruption and contain propagation of the error. For more information, see the *ARM® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile*.

The ARM abort model

The abort model used by an ARM PE is described as a *Base Restored Abort Model*. This means that if a synchronous Data Abort exception is generated by executing an instruction that specifies base register writeback, the value in the base register is unchanged.

The abort model applies uniformly across all instructions.

G1.16.9 Virtual SError interrupt exception

The Virtual SError interrupt exception is implemented only as part of EL2 is enabled in the current Security state.

A Virtual SError interrupt exception is generated in AArch32 state if all of the following apply:

- The PE is in a mode other than Hyp mode.
- The value of PSTATE.A is 0.
- Either:
  - EL2 is using AArch32 and the values of the HCR.{TGE, AMO, VA} bits are {0, 1, 1}.
  - EL2 is using AArch64 and the values of the HCR_EL2.{TGE, AMO, VA} bits are {0, 1, 1}.

The preferred return address for a Virtual SError interrupt exception is the address of the instruction immediately after the instruction boundary where the exception was taken. For an exception taken to AArch32 state, this return is performed using the SPSR and LR_abt values generated by the exception entry, using an exception return instruction without subtraction.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

The PE mode to which the Virtual SError interrupt exception is taken

The Virtual SError interrupt exception is taken using a vector offset of `0x10` from the Non-secure exception base address.

The conditions for generating a Virtual SError interrupt exception in AArch32 state mean the exception is:

- Taken from a EL1 or EL0 mode.
- Taken to Abort mode if EL1 is using AArch32.
- Taken to EL1, when EL0 is using AArch32 and EL1 is using AArch64.

For more information see *Virtual exceptions when an implementation includes EL2* on page G1-5274.

Note

Because a Virtual SError interrupt exception taken to AArch32 state is always taken to Abort mode, on exception entry the preferred return address is always saved to LR_abt.

Pseudocode description of taking the Virtual SError interrupt exception

The `AArch32.TakeVirtualSErrorException()` pseudocode procedure describes how the PE takes the exception.

G1.16.10 IRQ exception

The IRQ exception is generated by IMPLEMENTATION DEFINED means. Typically this is by asserting an IRQ interrupt request input to the PE.

When an IRQ exception is taken, exception entry is precise to an instruction boundary.

As described in *Asynchronous exception masking controls* on page G1-5277, IRQ exceptions can be masked. When this happens, a generated IRQ exception is not taken until it is not masked.

By default, when EL1 is using AArch32, an IRQ exception is taken to IRQ mode, but an IRQ exception can be taken to:

- EL2, meaning it is taken to Hyp mode if EL2 is using AArch32.
- EL3, meaning it is taken to Monitor mode if EL3 is using AArch32.

For more information:

- About cases where the exception is taken to an Exception level using AArch32 see *The PE mode to which the physical IRQ exception is taken* on page G1-5299.
- About cases where the exception is taken to an Exception level using AArch64 see *Pseudocode description of taking the physical IRQ exception* on page G1-5299.

The preferred return address for an IRQ exception is the address of the instruction following the instruction boundary at which the exception was taken. For an exception taken to AArch32 state this return is performed as follows:

- If returning from a mode other than Hyp mode, using the SPSR and LR values generated by the exception entry, using an exception return instruction with a subtraction of 4. This means using:
  - SPSR_irq and LR_irq if returning from IRQ mode.
  - SPSR_mon and LR_mon if returning from Monitor mode.
- If returning from Hyp mode, using the SPSR_hyp and ELR_hyp values generated by the exception entry, using an `ERET` instruction.

For more information, see *Exception return to an Exception level using AArch32* on page G1-5269.

The PE mode to which the physical IRQ exception is taken

Figure G1-9 shows how the implementation, state, and configuration options determine the mode to which an IRQ exception is taken when the exception is taken to an Exception level that is using AArch32.

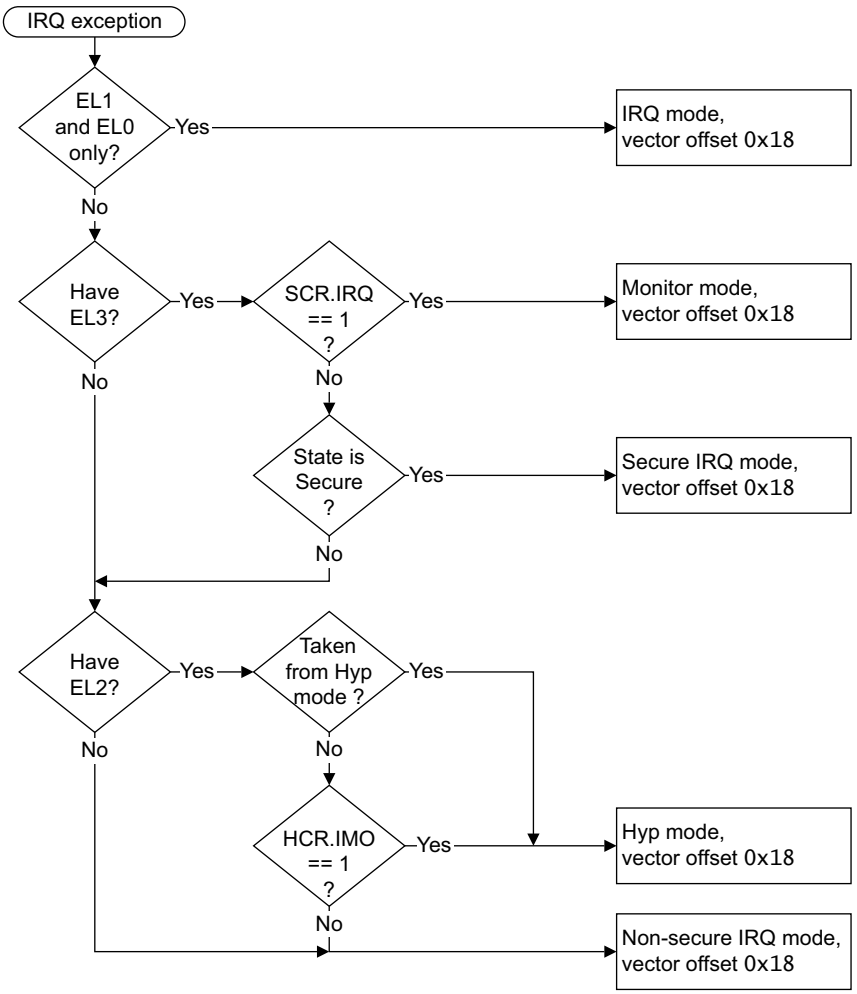

Figure G1-9 The PE mode the IRQ exception is taken to in AArch32 state

Pseudocode description of taking the physical IRQ exception

The `AArch32.TakePhysicalIRQException()` pseudocode procedure describes how the PE takes the exception. This procedure includes the case where the exception is taken to an Exception level that is using AArch64. This happens if one of the following applies:

- The exception is taken from User mode and EL1 is using AArch64. The Exception is taken to EL1 using AArch64.
- The exception is taken from User mode, EL2 is implemented in the current Security state and using AArch64, and the value of HCR_EL2.TGE is 1. The Exception is taken to EL2 using AArch64.
- The exception is taken from EL0 or EL1 mode, EL2 is implemented in the current Security state and using AArch64, and the value of HCR_EL2.IMO is 1. The Exception is taken to EL2 using AArch64.
- The exception is taken from a PE mode other than Monitor mode, EL3 is implemented and using AArch64, and the value of SCR_EL3.IRQ is 1. The Exception is taken to EL3 using AArch64.

G1.16.11 Virtual IRQ exception

The Virtual IRQ exception is implemented only as part of EL2, if EL2 is enabled in the current Security state.

A Virtual IRQ exception is generated in AArch32 state if all of the following apply:

- The PE is in a mode other than Hyp mode.
- The value of PSTATE.I is 0.
- Either:
  - EL2 is using AArch32 and the value of HCR.{TGE, IMO} is {0, 1}.
  - EL2 is using AArch64 and the value of HCR_EL2.{TGE, IMO} is {0, 1}.
- One of the following applies:
  - EL2 is using AArch32 and the value of HCR.VI is 1.
  - EL2 is using AArch64 and the value of HCR_EL2.VI is 1.
  - A Virtual IRQ exception is generated by an IMPLEMENTATION DEFINED mechanism.

The preferred return address for a Virtual IRQ exception is the address of the instruction immediately after the instruction boundary where the exception was taken. For an exception taken to AArch32 state this return is performed using the SPSR and LR_irq values generated by the exception entry, using an exception return instruction with a subtraction of 4.

The PE mode to which the Virtual IRQ exception is taken

The Virtual IRQ exception uses a vector offset of `0x18`.

The conditions for generating a Virtual IRQ exception in AArch32 state mean the exception is:

- Taken from an EL1 or EL0 mode.
- Taken to IRQ mode if EL1 is using AArch32.
- Taken to EL1 if EL0 is using AArch32 and EL1 is using AArch64.

For more information see *Virtual exceptions when an implementation includes EL2* on page G1-5274.

Pseudocode description of taking the Virtual IRQ exception

The `AArch32.TakeVirtualIRQException()` pseudocode procedure describes how the PE takes the exception.

G1.16.12 FIQ exception

The FIQ exception is generated by IMPLEMENTATION DEFINED means. Typically this is by asserting an FIQ interrupt request input to the PE.

When an FIQ exception is taken, exception entry is precise to an instruction boundary.

As described in *Asynchronous exception masking controls* on page G1-5277, FIQ exceptions can be masked. When this happens, a generated FIQ exception is not taken until it is not masked.

By default, an FIQ exception is taken to FIQ mode, but an FIQ exception can be taken to:

- EL2, meaning it is taken to Hyp mode if EL2 is using AArch32.
- EL3, meaning it is taken to Monitor mode if EL3 is using AArch32.

For more information:

- About cases where the exception is taken to an Exception level using AArch32 see *The PE mode to which the physical FIQ exception is taken* on page G1-5301.
- About cases where the exception is taken to an Exception level using AArch64 see *Pseudocode description of taking the FIQ exception* on page G1-5302.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

The preferred return address for an FIQ exception is the address of the instruction following the instruction boundary at which the exception was taken. For an exception taken to AArch32 state this return is performed as follows:

- If returning from a mode other than Hyp mode, using the SPSR and LR values generated by the exception entry, using an exception return instruction with a subtraction of 4. This means using:
  - SPSR_fiq and LR_fiq if returning from FIQ mode.
  - SPSR_mon and LR_mon if returning from Monitor mode.
- If returning from Hyp mode, using the SPSR_hyp and ELR_hyp values generated by the exception entry, using an `ERET` instruction.

For more information see *Exception return to an Exception level using AArch32* on page G1-5269.

The PE mode to which the physical FIQ exception is taken

Figure G1-9 on page G1-5299 shows how the implementation, state, and configuration options determine the PE mode to which an FIQ exception is taken when the exception is taken to an Exception level that is using AArch32.

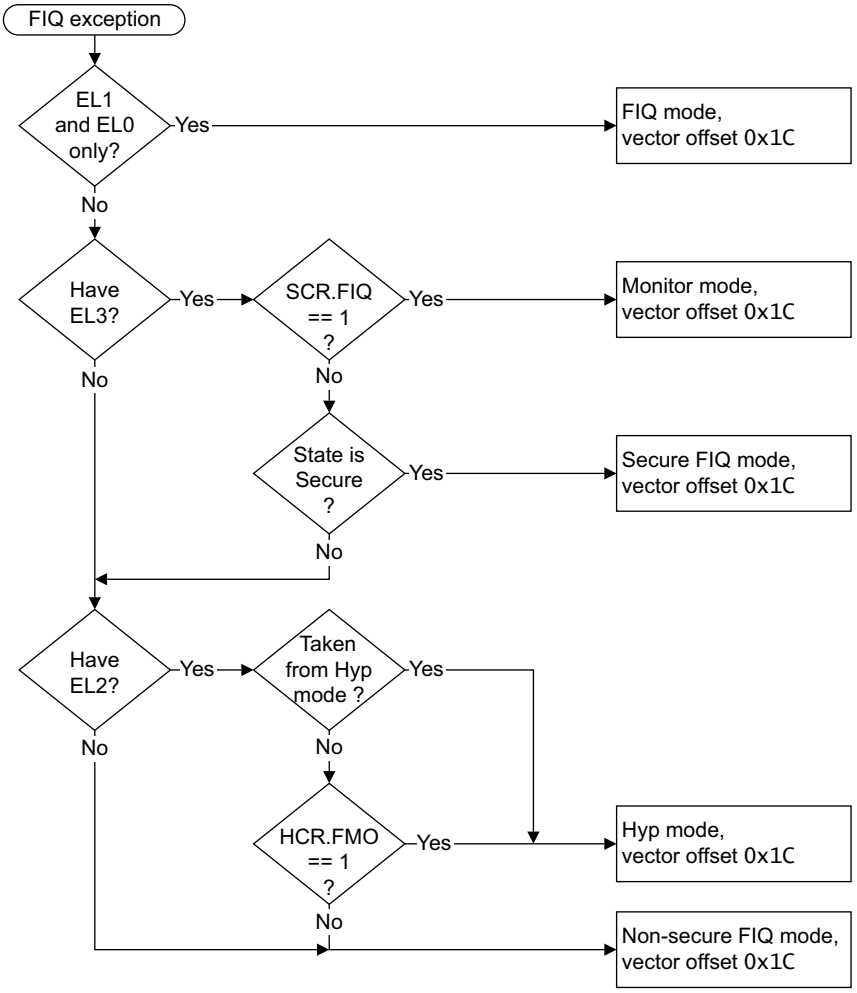

Figure G1-10 The PE mode the FIQ exception is taken to in AArch32 state

Pseudocode description of taking the FIQ exception

The `AArch32.TakePhysicalFIQException()` pseudocode procedure describes how the PE takes the exception. This procedure includes the case where the exception is taken to an Exception level that is using AArch64. This happens if one of the following applies:

- The exception is taken from User mode and EL1 is using AArch64. The Exception is taken to EL1 using AArch64.
- The exception is taken from User mode, EL2 is implemented in the current Security state and using AArch64, and the value of HCR_EL2.TGE is 1. The Exception is taken to EL2 using AArch64.
- The exception is taken from an EL0 or EL1 mode, EL2 is implemented in the current Security state and using AArch64, and the value of HCR_EL2.FMO is 1. The Exception is taken to EL2 using AArch64.
- The exception is taken from a PE mode other than Monitor mode, EL3 is implemented and using AArch64, and the value of SCR_EL3.FIQ is 1. The Exception is taken to EL3 using AArch64.

G1.16.13 Virtual FIQ exception

The Virtual FIQ exception is implemented only as part of EL2, if EL2 is enabled in the current Security state.

A Virtual FIQ exception is generated in AArch32 state if all of the following apply:

- The PE is in a mode other than Hyp mode.
- The value of PSTATE.F is 0.
- Either:
  - EL2 is using AArch32 and the value of HCR.{TGE, FMO} is {0, 1}.
  - EL2 is using AArch64 and the value of HCR_EL2.{TGE, FMO} is {0, 1}.
- One of the following applies:
  - EL2 is using AArch32 and the value of HCR.VF is 1.
  - EL2 is using AArch64 and the value of HCR_EL2.VF is 1.
  - A Virtual FIQ exception is generated by an IMPLEMENTATION DEFINED mechanism.

The preferred return address for a Virtual FIQ exception is the address of the instruction immediately after the instruction boundary where the exception was taken. For an exception taken to AArch32 state this return is performed using the SPSR and LR_irq values generated by the exception entry, using an exception return instruction with a subtraction of 4.

The PE mode to which the Virtual FIQ exception is taken

The Virtual FIQ exception is taken using a vector offset of `0x1C`.

The conditions for generating a Virtual FIQ exception in AArch32 state mean the exception is:

- Taken from EL1 or EL0.
- Taken to FIQ mode if EL1 is using AArch32.
- Taken to EL1 if EL0 is using AArch32 and EL1 is using AArch64.

For more information see *Virtual exceptions when an implementation includes EL2* on page G1-5274.

Pseudocode description of taking the Virtual FIQ exception

The `AArch32.TakeVirtualFIQException()` pseudocode procedure describes how the PE takes the exception.

G1.16.14 Additional pseudocode functions for exception handling

The `AArch32.EnterMonitorMode()` pseudocode function changes the PE mode to Monitor mode, with the required state changes.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

The `AArch32.EnterHypMode()` pseudocode function changes the PE mode to Hyp mode, with the required state changes.

The `AArch32.EnterMode()` pseudocode function changes the PE mode to a PL1 mode, with the required state changes. It is used for all exceptions that are not routed to Hyp mode or Monitor mode.

The `AArch32.EnterMonitorMode()`, `AArch32.EnterHypMode()`, and `AArch32.EnterMode()` functions are described in Chapter J1 *ARMv8 Pseudocode*.

G1.17 Reset into AArch32 state

Reset on page D1-2154 describes the ARMv8 reset model, including the defined levels of reset. When reset is deasserted, the PE starts executing instructions in the highest implemented Exception level. If that Exception level is using AArch32, then it starts execution:

- In Secure state, if the implementation includes EL3.
- With interrupts disabled:
  - In Hyp mode, if the highest implemented Exception level is EL2.
  - In Supervisor mode, otherwise.

Note

- This section describes the architectural requirements for a reset into AArch32 state. It takes no account of whether ARM licenses any particular combination of Exception levels and Execution state. For more information about the licensed combinations, see *Support for Exception levels and Execution states* on page D1-2265.
- The Execution state in which the highest implemented Execution level starts executing instructions on coming out of reset might be determined by a configuration input signal.

Reset returns some PE state to architecturally-defined or IMPLEMENTATION DEFINED values, and makes other state UNKNOWN, as described in *PE state on reset into AArch32 state* on page G1-5305. For more information about behavior when resetting into an Exception level using AArch32, see:

- *Behavior of caches at reset* on page G4-5439.
- *Enabling stages of address translation* on page G5-5474.
- *TLB behavior at reset* on page G5-5534.
- *Reset and debug* on page H6-6531.

When reset is deasserted, if the PE resets into an Exception level that is using AArch32, it is IMPLEMENTATION DEFINED whether execution starts:

- From an IMPLEMENTATION DEFINED address.
- If reset is into EL3 or EL1, from the low or high reset vector address, as determined by the reset value of the SCTLR.V bit. This reset value can be determined by an IMPLEMENTATION DEFINED configuration input signal.

  Note

  This option might be implemented for compatibility with earlier versions of the architecture.

Software might be able to identify the reset address:

- If reset is into EL3, by reading the reset value of MVBAR. That is, after coming out of reset, by reading MVBAR before the boot software has updated it. It is IMPLEMENTATION DEFINED whether this discovery mechanism is supported.
- If reset is into EL2 or EL1, by reading RVBAR. RVBAR can only be implemented at the highest implemented Exception level, and only if that Exception level is not EL3.

If RVBAR is not implemented, and at all Exception levels other than the highest implemented Exception level, the encoding for RVBAR is UNDEFINED.

The ARM architecture does not define any way of returning to a previous Execution state from a reset.

G1.17.1 PE state on reset into AArch32 state

Note

See the *ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0, and version 4.0* for the reset requirements for GIC System registers.

Immediately after a reset, much of the PE state is UNKNOWN. However, some of the PE state is defined. If the PE resets to AArch32 state using either a Cold or a Warm reset, the PE state that is defined is as follows:

- The global exclusive monitor and local exclusive monitor for the PE are UNKNOWN.
- If reset is into EL3 using AArch32, then all fields of the SCR reset to zero.

  Note

  This means SCR.NS correctly indicates that the PE is in Secure state.

- If reset is into EL2 using AArch32, then reset is into Hyp mode and CPSR.M resets to `0b1010`, otherwise reset is into Supervisor mode and CPSR.M resets to `0b0011`,
- CPSR.IL resets to 0.
- The CPACR.{cp11, cp10} fields reset to zero, and if CPACR.ASEDIS is implemented as an RW field it resets to zero.

  Note

  When CPACR.TRCDIS is an RW field, its reset value is architecturally UNKNOWN.

- PSTATE is reset to the values defined by the `AArch32.TakeReset()` pseudocode function, see *Pseudocode descriptions of reset* on page G1-5307.
- The FPEXC.EN field resets to 0.
- In the SCTLR:
  - The {AFE, TRE, UWXN, WXN, I, SED, ITD, C, A, M} fields reset to 0.
  - The {nTWE, nTWI, CP15BEN} fields reset to 1.
  - The {TE, EE, V} fields reset to IMPLEMENTATION DEFINED values, see the register description for more information.

  When the reset is to EL3 using AArch32 then these reset values apply only to the Secure instance of the SCTLR, and the reset value of the Non-secure SCTLR is architecturally UNKNOWN.
- All field of the TTBCR reset to 0.

  When the reset is to EL3 using AArch32 then:
  - All fields of the Secure TTBCR reset to 0.
  - In the Non-secure TTBCR, the EAE field resets to 0, and the reset values of all other fields are architecturally UNKNOWN.
- The VBAR resets to an IMPLEMENTATION DEFINED value.

  When the reset is to EL3 using AArch32 then this reset value applies only to the Secure instance of the register, and the reset value of the Non-secure VBAR is architecturally UNKNOWN.
- All fields of the DBGDCCINT reset to 0.
- The DBGDSCRext.{MDBGen, UDCCdis} fields reset to 0.
- The DBGOSDLR.DLK field resets to 0.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

In addition:

If the reset is into EL1 using AArch32

- In the RMR register, the RR field resets to 0 on any warm or cold reset, and the AA64 field resets to 0 on a Cold reset.

If the reset is into EL2 using AArch32

- In the HRMR, the RR field resets to 0 on any warm or Cold reset, and the AA64 field resets to 0 on a Cold reset.
- The HSCTLR.{I, C, M} fields all reset to 0, and the HSCTLR.EE field resets to an IMPLEMENTATION DEFINED value.

If the reset is into EL2 using AArch32 or into EL3 using AArch32

For a reset into EL3 using AArch32 these reset values apply only if the implementation includes EL2, see the register descriptions for more information.

- All fields of the HCPTR reset to zero.
- All fields of the HCR reset to zero.
- The HCR2.{ID, CD} fields reset to zero.
- All fields of the HSTR reset to zero.
- The VMPIDR resets to the value of the MPIDR, see the register description for more information.
- The VPIDR resets to the value of the MIDR, see the register description for more information.
- The VTTBR.VMID field resets to zero.
- In the HDCR:
  - The HPMN field resets to the IMPLEMENTATION DEFINED value of PMCR.N.
  - The reset value of the HPME field is architecturally UNKNOWN.
  - All other fields reset to 0.

If the reset is into EL3 using AArch32

- The MVBAR resets to an IMPLEMENTATION DEFINED value, see the register description for more information.
- If the NSACR.{NSTRCDIS, NSASEDIS} fields are RW fields then they reset to 0.
- In the RMR register, the RR field resets to 0 on any warm or Cold reset, and the AA64 field resets to 0 on a Cold reset.
- All fields of the SCR reset to zero.
- All fields of the SDER reset to 0.
- All fields of the SDCR reset to zero.

For either a warm or a Cold reset

- The EDPRSR.SR field resets to 1.
- The EDESR.{SS, RC, OSUC} fields reset to 0.

For a Cold reset only

- The EDSCR.{RXO, TXU, INTdis, TDA, MA, HDE, ERR, RXfull, TXfull} fields reset to 0.
- The EDECCR.{NSE, SE} fields reset to 0.
- The EDPRSR.{SPMAD, SDAD} fields reset to 0, and the EDPRSR.SPD field resets to 1.
- The DBGOSLSR.OSLK field resets to 1.
- The DBGPRCR.CORENPDRQ field resets to the value of EDPRCR.COREPURQ.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

An External Debug reset sets EDPRCR.COREPURQ to 0, see *External debug register resets on page H8-6558*. If an External Debug reset and a Cold reset coincide, both DBGPRCR.CORENPRDRQ and EDPRCR.COREPURQ are reset to 0.

- The debug CLAIM bits are reset to 0.

  Note

  These are the bits that are set to 1 by writing to DBGCLAIMSET.CLAIM, and reset to 0 by writing to DBGCLAIMCLR.CLAIM.

- Each bit of AMCNTENCLR0, AMCNTENCLR1, AMCNTENSET0, and AMCNTENSET1 is set to 0.
- Each of the implemented architected activity monitor counters AMEVCNTR0<n> and each of the implemented auxiliary activity monitor counters AMEVCNTR1<n> are set to 0.

For more information about resets in AArch32 System registers, see Chapter G8 *AArch32 System Register Descriptions*.

G1.17.2 Pseudocode descriptions of reset

The `AArch32.TakeReset()` pseudocode procedure describes how the PE behaves when reset is deasserted.

The `AArch32.ResetGeneralRegisters()` pseudocode function resets the general-purpose registers.

The `AArch32.ResetSIMDFPRegisters()` pseudocode function resets the SIMD and floating-point registers.

The `AArch32.ResetSpecialRegisters()` pseudocode function resets the Special-purpose registers, and the debug System registers DLR and DSPSR, that are used for handling Debug exceptions.

The `AArch32.ResetSystemRegisters()` pseudocode function resets all System registers in the (`coproc==0b111x`) encoding space to their reset state as defined in the register descriptions in Chapter G8 *AArch32 System Register Descriptions*.

Note

The `ResetSystemRegisters()` function only resets the System registers. It has no effect on memory-mapped registers.

The `ResetExternalDebugRegisters()` pseudocode function resets all external debug registers to their reset state as defined in the register descriptions in Chapter H9 *External Debug Register Descriptions*.

G1.18 Mechanisms for entering a low-power state

The following sections describe the architectural mechanisms that a PE can use to request entry to a low-power state:

- *Wait For Event and Send Event*.
- *Wait For Interrupt* on page G1-5311.

G1.18.1 Wait For Event and Send Event

The Wait For Event (WFE) mechanism permits a PE to request entry to a low-power state, and, if the request succeeds, to remain in that state until an event is generated by a Send Event operation, or another WFE wake-up event occurs. Example G1-2 describes how a spinlock implementation might use this mechanism to save energy.

Example G1-2 Spinlock as an example of using Wait For Event and Send Event

A multiprocessor operating system requires locking mechanisms to protect data structures from being accessed simultaneously by multiple PEs. These mechanisms prevent the data structures becoming inconsistent or corrupted if different PEs try to make conflicting changes. If a lock is busy, because a data structure is being used by one PE, it might not be practical for another PE to do anything except wait for the lock to be released. For example, if a PE is handling an interrupt from a device it might need to add data received from the device to a queue. If another PE is removing data from the queue, it will have locked the memory area that holds the queue. The first PE cannot add the new data until the queue is in a consistent state and the lock has been released. It cannot return from the interrupt handler until the data has been added to the queue, so it must wait.

Typically, a spin-lock mechanism is used in these circumstances:

- A PE requiring access to the protected data attempts to obtain the lock using single-copy atomic synchronization primitives such as the Load-Exclusive and Store-Exclusive operations described in *Synchronization and semaphores* on page E2-3605.
- If the PE obtains the lock, it performs its memory operation and releases the lock.
- If the PE cannot obtain the lock, it reads the lock value repeatedly in a tight loop until the lock becomes available. At this point, it again attempts to obtain the lock.

A spin-lock mechanism is not ideal for all situations:

- In a low-power system, the tight read loop is undesirable because it uses energy to no effect.
- In a multithreaded implementation, the execution of spin-locks by waiting threads can significantly degrade overall performance.

Using the Wait For Event and Send Event mechanism can improve the energy efficiency of a spinlock. In this situation, a PE that fails to obtain a lock can execute a Wait For Event instruction, `WFE`, to request entry to a low-power state. When a PE releases a lock, it must execute a Send Event instruction, `SEV`, causing any waiting PEs to wake up. Then, these PEs can attempt to gain the lock again.

The execution of a `WFE` instruction can cause suspension of execution only if all of the following are true:

- The instruction does not cause any other exception.
- When the instruction is executed:
  - The Event Register is not set.
  - There is not a pending WFE wakeup event.

For more information about the trap to EL2, see *Traps to Hyp mode of Non-secure EL0 and EL1 execution of WFE and WFI instructions* on page G1-5341.

The architecture does not define the exact nature of the low power state entered as a result of executing a `WFE` instruction, but the execution of a `WFE` instruction must not cause a loss of memory coherency.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Note

Although a complex operating system can contain thousands of distinct locks, the event sent by this mechanism does not indicate which lock has been released. If the event relates to a different lock, or if another PE acquires the lock more quickly, the PE fails to acquire the lock and can reenter the low-power state waiting for the next event.

The Wait For Event system relies on hardware and software working together to achieve energy saving:

- The hardware provides the mechanism to enter the Wait For Event low-power state.
- The operating system software is responsible for issuing:
  - A Wait For Event instruction, to request entry to the low-power state, used in the example when waiting for a spin-lock.
  - A Send Event instruction, required in the example when releasing a spin-lock.

The mechanism depends on the interaction of:

- WFE wake-up events, see *WFE wake-up events* on page G1-5310.
- The Event Register, see *The Event Register*.
- The Send Event instructions, see *The Send Event instructions* on page G1-5310.
- The Wait For Event instruction, see *The Wait For Event instruction*.

The Event Register

The Event Register is a single bit register for each PE. When set, an event register indicates that an event has occurred, since the register was last cleared, that might require some action by the PE. Therefore, the PE must not suspend operation on issuing a `WFE` instruction.

The reset value of the Event Register is UNKNOWN.

The Event Register for a PE is set by:

- The execution of an `SEV` instruction on any PE in the multiprocessor system.
- The execution of an `SEVL` instruction by the PE.
- An exception return.
- An event from a Generic Timer event stream, see *Event streams* on page G6-5607.
- An event sent by some IMPLEMENTATION DEFINED mechanism.

As shown in this list, the Event Register might be set by IMPLEMENTATION DEFINED mechanisms.

The Event Register is cleared only by a Wait For Event instruction.

Software cannot read or write the value of the Event Register directly.

The Wait For Event instruction

The action of the Wait For Event instruction depends on the state of the Event Register:

- If the Event Register is set, the instruction clears the register and completes immediately. Normally, if this happens the software makes another attempt to claim the lock.
- If the Event Register is clear the PE can suspend execution, and hardware might enter a low-power state. The PE can remain suspended until a WFE wake-up event or a reset occurs. When a WFE wake-up event occurs, or earlier if the implementation chooses, the `WFE` instruction completes.

The execution in AArch32 state of a `WFE` instruction that would otherwise cause suspension of execution might be trapped, see:

- *Traps to Undefined mode of EL0 execution of WFE and WFI instructions* on page G1-5325.
- *Traps to Hyp mode of Non-secure EL0 and EL1 execution of WFE and WFI instructions* on page G1-5341.
- *Traps to Monitor mode of the execution of WFE and WFI instructions in modes other than Monitor mode* on page G1-5352.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

The Wait For Event instruction, WFE, is available at all privilege levels, see *WFE* on page F5-4517.

Software using the Wait For Event mechanism must tolerate spurious wake-up events, including multiple wake ups.

WFE wake-up events

The following events are *WFE wake-up events*:

- The execution of an SEV instruction on any PE in the system.
- The execution of an SEVL instruction on the PE.
- A physical IRQ interrupt, unless masked by the PSTATE.I bit.
- A physical FIQ interrupt, unless masked by the PSTATE.F bit.
- A physical SError interrupt, unless masked by the PSTATE.A bit.
- In Non-secure state in any mode other than Hyp mode:
  - When HCR.IMO is set to 1, a virtual IRQ interrupt, unless masked by the PSTATE.I bit.
  - When HCR.FMO is set to 1, a virtual FIQ interrupt, unless masked by the PSTATE.F bit.
  - When HCR.AMO is set to 1, a virtual SError interrupt, unless masked by the PSTATE.A bit.
- An asynchronous External Debug Request debug event, if halting is allowed. For the definition of *halting is allowed*, see *Halting allowed and halting prohibited* on page H2-6419.

  See also *External Debug Request debug event* on page H3-6475.
- An event sent by the timer event stream, see *Event streams* on page D10-2639.
- An event sent by some IMPLEMENTATION DEFINED mechanism.
- An event caused by the clearing of the global monitor associated with the PE.

In addition to the possible masking of WFE wake-up events shown in this list, when invasive debug is enabled and EDSCR.HDE is set to 1, EDSCR.INTdis can mask interrupts, including masking them acting as WFE wake-up events. See the register description for more information.

As shown in the list of wake-up events, an implementation can include IMPLEMENTATION DEFINED hardware mechanisms to generate wake-up events.

Note

For more information about PSTATE masking, see *Asynchronous exception masking controls* on page G1-5277. If the configuration of the masking controls provided by EL2 and EL3 mean that a PSTATE mask bit cannot mask the corresponding exception, then the physical exception is a WFE wake-up event, regardless of the value of the PSTATE mask bit.

The Send Event instructions

The Send Event instructions are:

SEV, Send Event This causes an event to be signaled to all PEs in the multiprocessor system.

SEVL, Send Event Local
This must set the local Event Register. It might signal an event to other PEs, but is not required to do so.

The mechanism that signals an event to other PEs is IMPLEMENTATION DEFINED. The PE is not required to guarantee the ordering of this event with respect to the completion of memory accesses by instructions before the SEV instruction. Therefore, ARM recommends that software includes a DSB instruction before any SEV instruction.

Note

A DSB instruction ensures that no instruction, including any SEV instruction, that appears in program order after the DSB instruction, can execute until the DSB instruction has completed. For more information, see *Data Synchronization Barrier (DSB)* on page E2-3576.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

The SEVL instruction appears to execute in program order relative to any subsequent WFE instruction executed on the same PE, without the need for any explicit insertion of barrier instructions.

Execution of the Send Event instruction sets the Event Register.

The Send Event instructions are available at all privilege levels.

Pseudocode description of the Wait For Event mechanism

This section defines pseudocode functions that describe the operation of the Wait For Event mechanism.

The `ClearEventRegister()` pseudocode procedure clears the Event Register of the current PE.

The `IsEventRegisterSet()` pseudocode function returns TRUE if the Event Register of the current PE is set and FALSE if it is clear.

The `WaitForEvent()` pseudocode procedure optionally suspends execution until a WFE wake-up event or reset occurs, or until some earlier time if the implementation chooses. It is IMPLEMENTATION DEFINED whether restarting execution after the period of suspension causes a `ClearEventRegister()` to occur.

The `SendEvent()` pseudocode procedure sets the Event Register of every PE in the system.

G1.18.2 Wait For Interrupt

AArch32 state supports Wait For Interrupt through an instruction, WFI, that is provided in the A32 and T32 instruction sets. For more information, see *WFI* on page F5-4519.

When a PE issues a WFI instruction, its execution can be suspended, and a low-power state can be entered.

The execution in AArch32 state of a WFI instruction that would otherwise cause suspension of execution might be trapped, see:

- *Traps to Undefined mode of EL0 execution of WFE and WFI instructions* on page G1-5325.
- *Traps to Hyp mode of Non-secure EL0 and EL1 execution of WFE and WFI instructions* on page G1-5341.
- *Traps to Monitor mode of the execution of WFE and WFI instructions in modes other than Monitor mode* on page G1-5352.

The execution of a WFI instruction can cause suspension of execution only if both:

- The instruction does not cause any other exception.
- When the instruction is executed, there is not a pending WFI wakeup event.

WFI wake-up events

The PE can remain suspended in its WFI state until it is reset, or one of the following *WFI wake-up events* occurs:

- A physical IRQ interrupt, regardless of the value of the PSTATE.I bit.
- A physical FIQ interrupt, regardless of the value of the PSTATE.F bit.
- A physical SError interrupt, regardless of the value of the PSTATE.A bit.
- In Non-secure state in any mode other than Hyp mode:
  - When HCR.IMO is set to 1, a virtual IRQ interrupt, regardless of the value of the PSTATE.I bit.
  - When HCR.FMO is set to 1, a virtual FIQ interrupt, regardless of the value of the PSTATE.F bit.
  - When HCR.AMO is set to 1, a virtual SError interrupt, regardless of the value of the PSTATE.A bit.
- An asynchronous External Debug Request debug event, if halting is allowed. For the definition of *halting is allowed*, see *Halting allowed and halting prohibited* on page H2-6419.

  See also *External Debug Request debug event* on page H3-6475.

An implementation can include other IMPLEMENTATION DEFINED hardware mechanisms to generate WFI wake-up events.

When a WFI wake-up event is detected, or earlier if the implementation chooses, the WFI instruction completes.

WFI wake-up events cannot be masked by the mask bits in the PSTATE.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

The architecture does not define the exact nature of the low power state, but the execution of a WFI instruction must not cause a loss of memory coherency.

Note

- Because debug events are WFI wake-up events, ARM strongly recommends that Wait For Interrupt is used as part of an idle loop rather than waiting for a single specific interrupt event to occur and then moving forward. This ensures the intervention of debug while waiting does not significantly change the function of the program being debugged.
- In some previous implementations of Wait For Interrupt, the idle loop is followed by exit functions that must be executed before taking the interrupt. The operation of Wait For Interrupt remains consistent with this model, and therefore differs from the operation of Wait For Event.
- Some implementations of Wait For Interrupt drain down any pending memory activity before suspending execution. The ARM architecture does not require this operation, and software must not rely on Wait For Interrupt operating in this way.

Using WFI to indicate an idle state on bus interfaces

A common implementation practice is to complete any entry into powerdown routines with a WFI instruction. Typically, the WFI instruction:

1. Forces the completion of execution of any instructions that are in progress, and of all associated bus activity.
2. Suspends the execution of instructions by the PE.

The control logic required to do this tracks the activity of the bus interfaces used by the PE. This means it can signal to an external power controller when there is no ongoing bus activity.

However, memory-mapped and external debug interface accesses to debug registers must continue to be processed while the PE is in the WFI state. The indication of idle state to the system normally only applies to the non-debug functional interfaces used by the PE, not the debug interfaces.

If the OS Double Lock is implemented and the value of DBGOSDLR.DLK, the OS Double Lock status bit, is set to 1, this idle state must not be signaled to the PE unless the system can guarantee, also, that the debug interface is idle.

Note

When separate core and debug power domains are implemented, the debug interface referred to in this section is the interface between the core and debug power domains, since the signal to the power controller indicates that the core power domain is idle. For more information about the power domains, see *Power domains and debug* on page H6-6521.

The exact nature of this interface is IMPLEMENTATION DEFINED, but the use of Wait For Interrupt as the only architecturally-defined mechanism that completely suspends execution makes it very suitable as the preferred powerdown entry mechanism.

Pseudocode description of Wait For Interrupt

The `WaitForInterrupt`() pseudocode function optionally suspends execution until a WFI wake-up event or reset occurs, or until some earlier time if the implementation chooses.

G1.19 The AArch32 System register interface

In ARMv8, most System registers are accessed using the instructions described in *System register access instructions* on page F1-3639. The System register interface provides access to those instructions, and:

- These registers are encoded using the parameters {coproc, opc1, CRn, CRm, opc2}, with permitted coproc values of 0b1110 and 0b1111.
- Some of these encodings provide the AArch32 System instructions.
- To maintain compatibility with previous versions of the ARM architecture, the access controls for the AArch32 System registers include the access controls for AArch32 Advanced SIMD and floating-point functionality.

Note

See *Background to the System register interface* on page G1-5314 for more information.

The following sections give more information about the AArch32 System register interface:

- *System registers in the coproc == 0b111x encoding space*.
- *Access to System registers*.
- *Access controls for Advanced SIMD and floating-point functionality*.
- *Pseudocode description of checking accesses to the System registers* on page G1-5314.
- *Background to the System register interface* on page G1-5314.

G1.19.1 System registers in the coproc == 0b111x encoding space

In AArch32 state:

- The coproc == 0b1110 encoding space is reserved for the configuration and control of:
  - Debug features, see *Debug registers* on page G8-6103.
  - Trace features, see the *Embedded Trace Macrocell Architecture Specification*.
  - Identification registers for the Trivial Jazelle implementation, see *Trivial implementation of the Jazelle extension* on page G1-5245.
- The coproc == 0b1111 encoding space is reserved for the control and configuration of the PE, including architecture and feature identification. This means these encodings provide access to the System registers that control and return status information for PE operation.

For more information, see Chapter G8 *AArch32 System Register Descriptions*.

G1.19.2 Access to System registers

Most System registers are accessible only from EL1 or higher. For possible accesses from EL0 the register descriptions in Chapter G8 *AArch32 System Register Descriptions* indicate whether a register is accessible from EL0.

G1.19.3 Access controls for Advanced SIMD and floating-point functionality

In ARMv8, the CPACR controls access to Advanced SIMD and floating-point functionality from software executing at PL1 or EL0 in AArch32 state:

- The {cp10, cp11} fields control access to all Advanced SIMD and floating-point functionality, and can:
  - Disable EL0 and PL1 access to this functionality.
  - Enable access to this functionality at PL1 only.
  - Enable access to this functionality at EL0 and PL1.
- The ASEDIS field controls access to Advanced SIMD instructions that are not also floating-point instructions.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Initially on powerup or reset into AArch32 state, all access to all Advanced SIMD and floating-point functionality from PL1 and EL0 is disabled.

Note

The CPACR has no effect on accesses from Hyp mode.

If an implementation includes EL3, the NSACR determines whether Advanced SIMD and floating-point functionality can be accessed from Non-secure state:

- The {cp10, cp11} fields control Non-secure access to all Advanced SIMD and floating-point functionality.
- The NSASEDIS field controls Non-secure access to Advanced SIMD instructions that are not also floating-point instructions.

If an implementation includes EL2, the HCPTR provides additional controls on Non-secure accesses to Advanced SIMD and floating-point functionality. For accesses that are otherwise permitted by the CPACR and NSACR settings, setting HCPTR bits to 1:

- Traps otherwise-permitted accesses from EL1 or EL0 to EL2. When EL2 is using AArch32, these accesses are trapped to Hyp mode.
- Makes accesses from EL2 mode UNDEFINED. When EL2 is using AArch32, this makes accesses from Hyp mode UNDEFINED.

In the HCPTR:

- The {TCP10, TCP11} fields control access to all Advanced SIMD and floating-point functionality.
- The TASE field controls access to Advanced SIMD instructions that are not also floating-point instructions.
- The TCPAC field traps Non-secure EL1 accesses to the CPACR to Hyp mode.

For more information, see *General trapping to Hyp mode of Non-secure accesses to the SIMD and floating-point registers* on page G1-5342.

Note

Whenever a pair of fields control the access to the Advanced SIMD and floating-point functionality, the values of each field of the pair must be identical. In ARMv8, if these settings are not identical the behavior of the Advanced SIMD and floating-point functionality is CONSTRAINED UNPREDICTABLE, see *Handling of System register control fields for Advanced SIMD and floating-point operation* on page K1-7196.

For more information about Advanced SIMD and floating-point support, see *Advanced SIMD and floating-point support* on page G1-5316.

G1.19.4 Pseudocode description of checking accesses to the System registers

The `AArch32.CheckSystemAccess()` function determines whether a System register access instruction that targets a System register in the (`coproc == 0b111x`) encoding space is accepted.

G1.19.5 Background to the System register interface

Note

This section is not part of the ARMv8 Architecture specification. It is included only to present the rationale of some aspects of the System register interface.

The interface to the System registers was originally defined as part of a generic *coprocessor* interface, that gave access to 15 coprocessors, CP0 - CP15. Of these, CP8 - CP15 were reserved for use by ARM, while CP0 - CP7 were available for IMPLEMENTATION DEFINED coprocessors.

The coprocessors were accessed using coprocessor instructions. These instructions remain part of the T32 and A32 instruction sets, see *System register access instructions* on page F1-3639.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

In the ARM coprocessor model, a coprocessor included both:

- Primary and secondary coprocessor registers, that form part of the coprocessor interface.
- A number of internal registers.

When accessing a 32-bit internal coprocessor register, using an `MCR` or `MRC` instruction, the instruction specified:

- The target coprocessor, specified by the `coproc` parameter and taking a value between `p0` for CP0 and `p15` for CP15.
- The primary coprocessor register, specified by the `CRn` parameter and taking a value between `c0` and `c15`.
- The secondary coprocessor register, specified by the `CRm` parameter and taking a value between `c0` and `c15`.
- Up to two additional parameters, `opc1` and `opc2`, taking values between 0 and 7.

Other instructions in the group described in *System register access instructions* on page F1-3639 take a subset of these parameters:

- In the ARMv7 definitions, `LDC` and `STC` instructions take parameters {`coproc`, `CRd`}, where `CRd` is the primary coprocessor register.
- `MCRR` and `MRRC` instructions take parameters {`coproc`, `opc1`, `CRm`}, where `CRm` is the primary coprocessor register.

To maintain backwards compatibility, the arguments to an `MCR` or `MRC` instruction remain {`coproc`, `opc1`, `CRn`, `CRm`, `opc2`}. Correspondingly, the encoding of the AArch64 System registers is described using the parameters {`op0`, `op1`, `CRn`, `CRm`, `op2`}. However:

- The naming of these parameters no longer has any particular significance.
- While the `coproc` field is a 4-bit field, `op0` is a 2-bit field.

Of the coprocessors reserved for use by ARM, in ARMv7 and earlier versions of the architecture:

- CP15 provided access to the System registers relating to non-debug operation, and was originally called the System control coprocessor. In ARMv8, these registers are described as being in the `coproc == 0b1111` encoding space.
- CP14 provided access to additional System registers, including those relating to debug and trace. In ARMv8, these registers are described as being in the `coproc == 0b1110` encoding space.
- CP10 and CP11 were used for Advanced SIMD and floating-point control, and many coprocessor instruction encodings targeting CP10 and CP11 were used as floating-point instruction encodings:
  - Generally ARMv8 does not relate these instructions to the coprocessor encoding space, but the naming of registers and register fields for Advanced SIMD and floating-point control reflects the historic coprocessor model.
  - Because the Advanced SIMD and floating-point functionality used both CP10 and CP11, some System register controls of this functionality have a pair of fields, for example NSACR.{cp10, cp11}. In these cases, both fields must be set to the same value. For more information, see *Access controls for Advanced SIMD and floating-point functionality* on page G1-5313.

In ARMv8:

- The AArch32 System registers include registers that were described as Special registers in ARMv7 and earlier versions of the architecture. This means that the ARMv8 System registers include registers that are outside the earlier coprocessor model.
- The ARMv7 AArch32 instruction encodings for `LDC`, `STC`, `MCR`, `MRC`, `MCRR`, and `MRRC` instructions with `coproc` field values other than {`1010`, `1011`, `1110`, `1111`} are available for reuse. ARMv8.2 re-uses some encodings in this way.

G1.20 Advanced SIMD and floating-point support

Advanced SIMD and floating-point instructions on page E1-3548 introduces:

- The scalar floating-point instructions in the A32 and T32 instruction sets.
- The Advanced SIMD integer and floating-point vector instructions in the A32 and T32 instruction sets.
- The SIMD and floating-point register file, that can be viewed as:
  - Singleword registers S0 - S31.
  - Doubleword registers D0 - D31.
  - Quadword registers Q0 - Q15.
- The *Floating-Point Status and Control Register* (FPSCR).

For more information about the System registers for the Advanced SIMD and floating-point operation, see *Advanced SIMD and floating-point System registers* on page G1-5318. Software can interrogate these registers to discover the implemented Advanced SIMD and floating-point support.

AArch32 implications of not including support for Advanced SIMD and floating-point summarizes the effects of not supporting these instructions, and the following subsections give more information about the Advanced SIMD and Floating-point support:

- *Enabling Advanced SIMD and floating-point support*.
- *Advanced SIMD and floating-point System registers* on page G1-5318.
- *Context switching when using Advanced SIMD and floating-point functionality* on page G1-5319.
- *Floating-point exceptions and exception traps* on page G1-5320.

G1.20.1 AArch32 implications of not including support for Advanced SIMD and floating-point

As stated in *Implementations not including Advanced SIMD and floating-point instructions* on page D1-2265, although ARMv8-A generally requires the inclusion of the Advanced SIMD and floating-point instructions in all instruction sets, for implementations targeting specialized markets, ARM might produce or license ARMv8-A implementations that do not provide any support for Advanced SIMD and floating-point instructions. In such an implementation, in AArch32 state:

- The CPACR.{ASEDIS, cp11, cp10} fields are RES0.
- The NSACR.{NSASEDIS, cp11, cp10} fields are RES0.
- The HCPTR.{TASE, TCP11, TCP10} fields are RES1.
- The FPEXC, FPSCR, FPSID, MVFR0, MVFR1, and MVFR2 registers are not implemented and their encodings are UNDEFINED.
- Attempted accesses to Advanced SIMD and floating-point functionality are UNDEFINED. This means:
  - All Advanced SIMD and floating-point instructions are UNDEFINED.
  - Attempts to access the Advanced SIMD and floating-point System registers are UNDEFINED.

G1.20.2 Enabling Advanced SIMD and floating-point support

Software must ensure that the required access to the Advanced SIMD and floating-point features is enabled. Most of those controls are described in *Configurable instruction enables and disables, and trap controls* on page G1-5322, and this section:

- Summarizes those controls.
- Provides additional information in the following subsections:
  - *FPEXC control of access to Advanced SIMD and floating-point functionality* on page G1-5318.
  - *EL0 access to Advanced SIMD and floating-point functionality* on page G1-5318.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Note

This section shows the controls when the controlling Exception levels are using AArch32. Similar controls are provided when the Exception levels are using AArch64, and then apply to lower Exception levels that are using AArch32.

The controls of access to Advanced SIMD and floating-point functionality are:

General {cp10, cp11} or {TCP10, TCP11} controls

This relates to the CPACR.{cp10, cp11}, NSACR.{cp10, cp11}, and HCPTR.{TCP10, TCP11} controls.

Note

Background to the System register interface on page G1-5314 explains the naming of these controls.

The {cp10, cp11} controls provide general control of the use of Advanced SIMD and floating-point functionality, as follows:

- CPACR.{cp10, cp11} control access from PE modes other than Hyp mode.

  These fields have no effect on accesses to Advanced SIMD and floating-point functionality from Hyp mode.
- In an implementation that includes EL3, NSACR.{cp10, cp11} control access from Non-secure state.
- In an implementation that includes EL2, if NSACR.{cp10, cp11} permit Non-secure accesses, or if EL3 is not implemented, HCPTR.{TCP10, TCP11} provide an additional control on those accesses.

In each case, the {cp10, cp11} controls must be programmed to the same value, otherwise operation is CONSTRAINED UNPREDICTABLE. The ARMv8 CONSTRAINED UNPREDICTABLE behavior is that, for all purposes other than reading the value of the register field, behavior is as if the cp11 field has the same value as the cp10 field. For more information, see *Handling of System register control fields for Advanced SIMD and floating-point operation* on page K1-7196.

For more information about these controls, see:

- *Enabling PL0 and PL1 accesses to the SIMD and floating-point registers* on page G1-5327.
- *General trapping to Hyp mode of Non-secure accesses to the SIMD and floating-point registers* on page G1-5342.
- *Enabling Non-secure access to SIMD and floating-point functionality* on page G1-5354.

Control of accesses to the CPACR from Non-secure PL1 modes

As stated in *General {cp10, cp11} or {TCP10, TCP11} controls*, the CPACR controls access to Advanced SIMD and floating-point functionality from PE modes other than Hyp mode. Accesses to the CPACR from Non-secure PL1 modes can be trapped to EL2, see *Traps to Hyp mode of Non-secure EL1 accesses to the CPACR* on page G1-5343.

Additional controls of Advanced SIMD functionality

- If implemented as an RW field, CPACR.ASEDIS can make all Advanced SIMD instructions UNDEFINED in all modes other than Hyp mode.
- In an implementation that includes EL3, when CPACR.ASEDIS permits use of the Advanced SIMD instructions or if the CPACR.ASEDIS control is not implemented, NSACR.NSASEDIS can make all Advanced SIMD instructions UNDEFINED in Non-secure state.
- In an implementation that includes EL2, when the CPACR and NSACR settings permit Non-secure use of the Advanced SIMD instructions, if HCPTR.TASE is implemented as an RW field it can make these instructions UNDEFINED in Hyp mode, and trap to Hyp mode any use of these instructions in a Non-secure PL0 or PL1 mode.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

For more information about these controls, see:

- *Disabling PL0 and PL1 execution of Advanced SIMD instructions* on page G1-5328.
- *Traps to Hyp mode of Non-secure accesses to Advanced SIMD functionality* on page G1-5343.
- *Disabling Non-secure access to Advanced SIMD functionality* on page G1-5355.

Pseudocode description of enabling SIMD and floating-point functionality on page G1-5355 provides links to the pseudocode descriptions of all of these controls.

FPEXC control of access to Advanced SIMD and floating-point functionality

In addition, FPEXC.EN is an enable bit for most Advanced SIMD and floating-point operations. When FPEXC.EN is 0, all Advanced SIMD and floating-point instructions are treated as UNDEFINED except for:

- A `VMSR` to the FPEXC or FPSID register.
- A `VMRS` from the FPEXC, FPSID, MVFR0, MVFR1, or MVFR2 register.

These instructions can be executed only at EL1 or higher.

Note

- When the FPSID is accessible, any write access to the FPSID is ignored.
- When FPEXC.EN is 0, these operations are treated as UNDEFINED:
  - A `VMSR` to the FPSCR.
  - A `VMRS` from the FPSCR.

See *Enabling access to the SIMD and floating-point registers* on page G1-5328 for more information about the scope of the FPEXC.EN control.

When executing at EL0, the PE behaves as if the value of FPEXC.EN is 1 if either:

- EL1 is using AArch64.
- EL2 is enabled in the current Security state and is using AArch64. and the value of HCR_EL2.TGE is 1.

Note

In Non-secure state, if the value of HCR_EL2.RW is 0 then it is permitted for the value of FPEXC32_EL2.EN to control whether Advanced SIMD and floating-point functionality is enabled. However, ARM deprecates using the value of FPEXC32_EL2.EN to determine behavior.

EL0 access to Advanced SIMD and floating-point functionality

When the access controls summarized in this section permit EL0 access to the Advanced SIMD and floating-point functionality, this applies only to the subset of functionality that is available at EL0. In particular:

- Only Advanced SIMD and Floating-point System register that is accessible is the FPSCR.
- The Advanced SIMD and floating-point instructions are available.

Execution at EL0 corresponds to the application level view of the Advanced SIMD and floating-point functionality, as described in *Advanced SIMD and floating-point System registers* on page E1-3550.

G1.20.3 Advanced SIMD and floating-point System registers

AArch32 state provides a common set of System registers for the Advanced SIMD and floating-point functionality. This section gives general information about this set of registers, and indicates where each register is described in detail. It contains the following subsections:

- *Register map of the Advanced SIMD and floating-point System registers* on page G1-5319.
- *Accessing the Advanced SIMD and floating-point System registers* on page G1-5319.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Register map of the Advanced SIMD and floating-point System registers

Table G1-21 shows the register map of the Advanced SIMD and Floating-point registers. Each register is 32 bits wide.

Table G1-21 Floating-point registers

Name	Permitted access
FPEXC	RW
FPSCR	RW
FPSID	RW[a]
MVFR0	RO
MVFR1	RO
MVFR2	RO

a. When FPSID is accessible, VMSR accesses to FPSID are ignored.

In an implementation that includes EL3, the Advanced SIMD and Floating-point registers are common registers, see *Common System registers* on page G5-5597.

Accessing the Advanced SIMD and floating-point System registers

Software accesses the Advanced SIMD and floating-point System registers using the VMRS and VMSR instructions, see:

- *VMRS* on page F6-4902.
- *VMSR* on page F6-4905.

For example:

```
VMRS <Rt>, FPSID    ; Read  Floating-Point System ID Register
VMRS <Rt>, MVFR1    ; Read  Media and VFP Feature Register 1
VMSR FPSCR, <Rt>    ; Write Floating-Point System Control Register
```

Software can access the Advanced SIMD and floating-point System registers only if the access controls permit the access, see *Enabling Advanced SIMD and floating-point support* on page G1-5316.

Note

All hardware ID information can be accessed only from EL1 or higher. This means:

The FPSID is accessible only from EL1 or higher.

This is a change introduced from VFPv3. Previously, the FPSID register can be accessed in all modes.

The MVFR registers are accessible only from EL1 or higher.

Unprivileged software must issue a system call to determine what features are supported.

G1.20.4 Context switching when using Advanced SIMD and floating-point functionality

When the Advanced SIMD and floating-point functionality is used by only a subset of processes, the operating system might implement lazy context switching of the Advanced SIMD and floating-point register file and System registers.

In the simplest lazy context switch implementation, the primary context switch software uses the CPACR.{cp10, cp11} controls to disable access to the Advanced SIMD and floating-point functionality, see *Enabling Advanced SIMD and floating-point support* on page G1-5316. Subsequently, when a process or thread attempts to use an Advanced SIMD or floating-point instruction, it triggers an Undefined Instruction exception. The

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

operating system responds by saving and restoring the Advanced SIMD and floating-point register file and System registers. Typically, it then re-executes the Advanced SIMD or floating-point instruction that generated the Undefined Instruction exception.

G1.20.5 Floating-point exceptions and exception traps

Execution of a floating-point instruction can generate an exceptional condition, called a *floating-point exception*.

The ARMv8-A architecture supports synchronous exception generation in the event of any or all of the following floating-point exceptions:

- Input Denormal.
- Inexact.
- Underflow.
- Overflow.
- Divide by Zero.
- Invalid Operation.

Note

Do not confuse floating-point exceptions with the AArch32 architectural exceptions summarized in *AArch32 state exception descriptions* on page G1-5282.

Whether an implementation includes synchronous exception generation for these floating-point exceptions is IMPLEMENTATION DEFINED:

- For an implementation that does provide this capability, FPSCR.{IDE, IXE, UFE, OFE, DZE, IOE} are the control bits that enable synchronous exception generation for each of the floating-point exceptions.
- For an implementation that does provide this capability, the FPSCR.{IDE, IXE, UFE, OFE, DZE, IOE} are RAZ/WI.

Note

- An Input Denormal floating-point exception is generated when a single-precision or double-precision floating-point value is flushed-to-zero because the value of FPSCR.FZ is 1. However, no Input Denormal exception is generated when a half-precision floating-point value is flushed-to-zero because the value of FPSCR.FZ16 is 1.
- The ARMv8-A architecture does not support asynchronous reporting of floating-point exceptions.

Trapped exception handling never causes the corresponding cumulative exception bit of the FPSCR to be set to 1. If this behavior is desired, the trap handler routine must use a read, modify, write sequence on the FPSCR to set the cumulative exception bit.

When generating synchronous exceptions for one or more floating-point exceptions is enabled, the synchronous exceptions generated by the floating-point exception traps are taken to the lowest Exception level that can handle such an exception, while adhering to the rule that an exception can never be taken to a lower Exception level. This means that trapped floating-point exceptions taken:

- From EL0 are taken to EL1, except for the following cases when they are taken from EL0 to EL2:
  - EL2 is using AArch32 and the value of HCR.TGE is 1.
  - EL2 is using AArch64 and the value of HCR_EL2.TGE is 1
- From EL1 are taken to EL1.
- From EL2 are taken to EL2.
- From EL3 are taken to EL3.

If the exception is taken to an Exception level that is using AArch64, then it is reported in the ELR_ELx for the Exception level to which it is taken, as described in *Exception entry* on page D1-2158.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

If the exception is taken to an Exception level that is using AArch32, then it is taken as an Undefined Instruction exception, see *Undefined Instruction exception* on page G1-5282. The FPEXC identifies the floating-point exceptions that occurred since the corresponding status bits in that register were last set to 0.

See also *Floating-point exceptions and exception traps* on page E1-3551.

In an implementation that provides synchronous exception generation for floating-point exceptions:

- Synchronous exception generation applies to floating-point exceptions generated by scalar SIMD and floating-point instructions executed in AArch32 state.
- The registers that are presented to the exception handler are consistent with the state of the PE immediately before the instruction that caused the exception. An implementation is permitted not to restore the cumulative exception flags in the event of such an exception.

ARMv8 does not support the trapping of floating-point exceptions from Advanced SIMD instructions executed in AArch32 state.

The `AArch32.FPTrappedException()` and `FPProcessException()` pseudocode functions describe the handling of trapped floating-point exceptions generated in AArch32 state.

The `AArch32.FPTrappedException()` and `FPProcessException()` functions are described in Chapter J1 *ARMv8 Pseudocode*.

G1.21 Configurable instruction enables and disables, and trap controls

This section describes the controls provided by AArch32 state for enabling, disabling, and trapping particular instructions. Each control is categorized as an *instruction enable*, an *instruction disable*, or a *trap control*:

Instruction enables and instruction disables

Enable or disable the use of one or more particular instructions at a particular Privilege level and Security state.

When an instruction is disabled as a result of an instruction enable or disable, it is UNDEFINED.

The exception generated by attempting to executed an UNDEFINED instruction is:

- Taken to EL1 if the UNDEFINED instruction was executed at EL0, unless the instruction was executed at Non-secure EL0 and is routed to EL2 by the control described in *Routing exceptions from Non-secure EL0 to EL2* on page G1-5262.

  When the exception is taken to EL1, it is taken to Undefined mode.
- Otherwise, taken to the Exception level at which the UNDEFINED instruction was executed:
  - If the instruction was executed in Hyp mode the exception is taken to Hyp mode.
  - Otherwise, the exception is taken to Undefined mode.

Trap controls

Control whether one or more instructions, when executed at a particular Privilege level, are *trapped*.

Note

AArch32 trap controls are described in terms of Privilege levels, rather than Exception levels, because the PL1 traps apply at and are controlled from:

EL1 In Non-secure state, and in Secure state when EL3 is using AArch64.

EL3 In Secure state when EL3 is using AArch32.

For more information see *Security state, Exception levels, and AArch32 execution privilege* on page G1-5226.

Trap controls are grouped as:

PL1, excluding Monitor mode

Trapped instructions generate Undefined Instruction exceptions that are taken to Undefined mode, unless the instruction was executed at Non-secure EL0 and is routed to EL2 by the control described in *Routing exceptions from Non-secure EL0 to EL2* on page G1-5262.

For more information about these traps, see *PL1 configurable controls* on page G1-5323.

Hyp mode (PL2)

These traps apply only to execution in Non-secure state. This section only describes the traps that apply when EL2 is using AArch32.

Trapped instructions generate:

- Hyp Trap exceptions, taken to Hyp mode, if trapped from a mode other than Hyp mode.
- Undefined Instruction exceptions taken to Hyp mode, if trapped from Hyp mode.

For more information about these traps, see *EL2 configurable controls* on page G1-5331.

See also *Routing exceptions from Non-secure EL0 to EL2* on page G1-5262.

Monitor mode (Secure PL1)

This section only describes the traps that apply when EL3 is using AArch32.

Trapped instructions generate Monitor Trap exceptions, that are taken to Monitor mode.

For more information about these traps, see *EL3 configurable controls* on page G1-5350.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

An exception generated as a result of an instruction enable or disable, or a trap control, is only taken if the instruction does not also generate a higher priority exception. *Exception prioritization for exceptions taken to AArch32 state* on page G1-5250 defines the prioritization of different exceptions on the same instruction.

Exceptions generated as a result of these controls are synchronous exceptions.

For exceptions taken to an Exception level that is using AArch32, only exceptions that are taken to Hyp mode are reported in a syndrome register, the HSR.

Note

- A particular control might have a mnemonic that suggests it is different type of control to the control type it is categorized as. For example, CPACR.TRCDIS is a trap control even though TRCDIS is a mnemonic for Trace Disable.
- An implementation might provide additional controls, in IMPLEMENTATION DEFINED registers, to provide control of trapping of IMPLEMENTATION DEFINED features.
- *Configurable instruction enables and disables, and trap controls* on page D1-2196 describes controls provided by AArch64 state for enabling, disabling, and trapping instructions. Generally, where an AArch64 control applies to execution at lower Exception levels, it traps the equivalent functionality when that lower Exception level is using AArch32. See the AArch64 trap controls for more information.

This section is organized as follows:

- *Register access instructions*.
- *PL1 configurable controls*.
- *EL2 configurable controls* on page G1-5331.
- *EL3 configurable controls* on page G1-5350.
- *Pseudocode description of configurable instruction enables, disables, and traps* on page G1-5355.

G1.21.1 Register access instructions

When an instruction is disabled or trapped, the exception is taken before execution of the instruction. This means that if the instruction is a register access instruction:

- No access is made before the exception is taken.
- Side-effects that are normally associated with the access do not occur before the exception is taken.

G1.21.2 PL1 configurable controls

In AArch32 state, each control is associated with a particular System register field that is accessible:

- When EL3 is using AArch64, or when an implementation does not include EL3, from EL1.
- When EL3 is using AArch32:
  - In Non-secure state, from EL1.
  - In Secure state, from EL3.

This means that the controls are described as PL1 controls, because PL1 is defined as being the Privilege level of software that is executing:

- At EL3, if the PE is executing in EL3 and EL3 is using AArch32.
- At EL1 under all other conditions.

Where there is an AArch64 control that is equivalent to an AArch32 PL1 control, the AArch64 control is an EL1 control.

Any exception that is generated because of an AArch32 PL1 control is taken to a PL1 mode.

Note

Any exception generated because of an AArch32 PL1 control is taken to AArch32 state.

When generated in Non-secure User mode, exceptions generated by these controls can be routed to EL2, as described in *Routing exceptions from Non-secure EL0 to EL2* on page G1-5262.

Instructions that fail their Condition code check

See *Conditional execution of undefined instructions* on page G1-5284.

Trapping to PL1 of instructions that are UNPREDICTABLE

For an instruction that is UNPREDICTABLE or CONSTRAINED UNPREDICTABLE, when the instruction is disabled or trapped then it is CONSTRAINED UNPREDICTABLE whether execution of the instruction generates an Undefined Instruction exception.

Traps to Undefined mode of EL0 execution of `WFE` and `WFI` instructions

SCTLR.{nTWE, nTWI} trap EL0 execution of `WFE` and `WFI` instructions to Undefined mode:

SCTLR.nTWE

1 This control has no effect on the EL0 execution of `WFE` instructions.

0 Any attempt to execute a `WFE` instruction at EL0 is trapped to Undefined mode, if the instruction would otherwise have caused the PE to enter a low-power state.

SCTLR.nTWI

1 This control has no effect on the EL0 execution of `WFI` instructions.

0 Any attempt to execute a `WFI` instruction at EL0 is trapped to Undefined mode, if the instruction would otherwise have caused the PE to enter a low-power state.

The attempted execution of a conditional `WFE` or `WFI` instruction is only trapped if the instruction passes its Condition code check.

Note

Since a `WFE` or `WFI` can complete at any time, even without a Wakeup event, the traps on `WFE` of `WFI` are not guaranteed to be taken, even if the `WFE` or `WFI` is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When generated in Non-secure User mode, exceptions generated by these controls can be routed to EL2, as described in *Routing exceptions from Non-secure EL0 to EL2* on page G1-5262.

For more information about these instructions, and when they can cause the PE to enter a low-power state, see:

- *Wait For Event and Send Event* on page G1-5308.
- *Wait For Interrupt* on page G1-5311.

Disabling or enabling PL0 and PL1 use of AArch32 deprecated functionality

Table G1-25 on page G1-5326 shows the deprecated AArch32 functionality that might have disable controls in the SCTLR:

- The SED control is always implemented.
- Whether each of the ITD or CP15BEN controls is implemented is IMPLEMENTATION DEFINED. If a control is not implemented, then the associated functionality cannot be disabled.

When an instruction is disabled by one of these controls, it is UNDEFINED at PL0 and PL1. This means an attempt to execute the instruction at PL0 or PL1 generates an Undefined Instruction exception that is taken to Undefined mode, unless both of the following apply, in which case the attempted execution generates an exception that is taken to EL2, as described in *Routing exceptions from Non-secure EL0 to EL2* on page G1-5262:

- The instruction is executed at Non-secure EL0 using AArch32.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

- Either:
  - EL2 is using AArch32 and the value of HCR.TGE is 1.
  - EL2 is using AArch64 and the value of HCR_EL2.TGE is 1.

Table G1-25 PL1 controls for disabling and enabling PL0 and PL1 use of AArch32 deprecated functionality

Deprecated AArch32 functionality	Instruction enable or disable in the SCTLR[a]	Disabled instructions
SETEND instructions	SED[b]	SETEND instructions
Some uses of IT instructions	ITD[c]	See the SCTLR.ITD description
Accesses to the CP15DMB, CP15DSB, and CP15ISB barrier instructions	CP15BEN[d]	MCR accesses to the CP15DMB, CP15DSB, and CP15ISB instructions

a. The controls that are implemented in SCTLR are also implemented in SCTLR_EL1, and apply when PL1 is using AArch64 and PL0 is using AArch32.
b. SETEND instruction disable. SETEND instructions are disabled when the value of this field is 1.
c. IT instruction disable. If this control is implemented, some uses of IT instructions are disabled when the value of this field is 1.
d. System register (coproc==0b1111) memory barrier enable. If this control is implemented, the specified register accesses are disabled when the value of CP15BEN is 0.

Note

The uses of the IT instruction, and use of the CP15DMB, CP15DSB, and CP15ISB barrier instructions, are deprecated for performance reasons.

Traps to Undefined mode of PL0 and PL1 System register accesses to trace registers

If implemented, the CPACR.TRCDIS control traps PL0 and PL1 System register accesses to the trace registers to Undefined mode, as follows:

1 PL0 and PL1 accesses to the System register interface to the PE Trace Unit are trapped to Undefined mode

0 This control has no effect on PL0 and PL1 accesses to the System register interface to the PE Trace Unit.

If the CPACR.TRCDIS control is not implemented, then the CPACR.TRCDIS field is RAZ/WI. This means the CPACR does not provide a trap to Undefined mode of PL1 and PL0 System register accesses to trace registers. See the register description for more information.

Note

- System register accesses to the PE Trace Unit use the (coproc==0b1110) encoding space.
- The ETMv4 architecture does not permit EL0 to access the trace registers. If the ARMv8-A architecture is implemented with an ETMv4 implementation, EL0 accesses to the trace System registers are UNDEFINED.
- The ARMv8-A architecture does not provide traps on trace register accesses through the optional memory-mapped external debug interface.

System register accesses to the trace System registers can have side effects. When a System register access is trapped, no side effects occur before the exception is taken, see *Register access instructions* on page G1-5323.

If EL3 is implemented and is using AArch32, and NSACR.NSTRCDIS is 1, CPACR.TRCDIS behaves as RAO/WI in Non-secure state. This behavior also applies if the CPACR.TRCDIS control is not implemented.

When generated in Non-secure User mode, an exception generated by this control can be routed to EL2, as described in *Routing exceptions from Non-secure EL0 to EL2* on page G1-5262.

Enabling use of Advanced SIMD and floating-point functionality

Table G1-26 summarizes the controls of Advanced SIMD and floating-point functionality.

Table G1-26 Controls of use of Advanced SIMD and floating-point functionality

Control	Type	Description, see
CPACR.{cp11, cp10}	E	*Enabling PL0 and PL1 accesses to the SIMD and floating-point registers*
FPEXC.EN	E	*Enabling access to the SIMD and floating-point registers* on page G1-5328
CPACR.ASEDIS	D	*Disabling PL0 and PL1 execution of Advanced SIMD instructions* on page G1-5328

If any of CPACR.{cp11, cp10}, FPEXC.EN, or for Advanced SIMD instructions, CPACR.ASEDIS, disable a floating-point or an Advanced SIMD instruction, the instruction is UNDEFINED. Support for the CPACR.ASEDIS control is optional, and if the control is not implemented behavior is as if the control permits the execution of Advanced SIMD instructions at PL1 and PL0.

When generated in Non-secure User mode, exceptions generated by these controls can be routed to EL2, as described in *Routing exceptions from Non-secure EL0 to EL2* on page G1-5262.

Enabling PL0 and PL1 accesses to the SIMD and floating-point registers

CPACR.{cp11, cp10} enable PL0 and PL1 accesses to the SIMD and floating-point registers.

When CPACR.cp10 is:

00 PL0 and PL1 accesses to Advanced SIMD and floating-point registers or instructions are UNDEFINED.

01 PL0 accesses to Advanced SIMD and floating-point registers or instructions are UNDEFINED.

10 Reserved. The effect of programming this field to this value is CONSTRAINED UNPREDICTABLE.

11 This control permits full access to the Advanced SIMD and floating-point functionality from PL0 and PL1.

The value of CPACR.cp11 is ignored. If CPACR.cp11 is programmed with a different value to CPACR.cp10 then CPACR.cp11 is UNKNOWN on a direct read of the CPACR.

Note

- Software must set CPACR.cp11 and CPACR.cp10 to the same value.

Table G1-27 shows the registers for which accesses are enabled.

Table G1-27 Register accesses enabled at PL0 and PL1 by CPACR.{cp11, cp10}

Enabled at	Registers
PL0 and PL1, or PL0 only[a]	FPSCR, FPEXC, FPSID, MVFR0, MVFR1, MVFR2, and any of the SIMD and floating-point registers Q0-Q15, including their views as D0-D31 registers or S0-S31 registers[b]

a. Depending on the value of CPACR.{cp11, cp10}. See the register description for details.

b. Permitted `VMSR` accesses to the FPSID are ignored, but for the purposes of the {cp10, cp11} controls the architecture defines a `VMSR` accesses to the FPSID from EL1 or higher is an access to a SIMD and floating-point register.

If EL3 is implemented and is using AArch32, and NSACR.{cp11, cp10} are both set to 0, the functionality described in this section is disabled in Non-secure state, and CPACR.{cp11, cp10} are RAZ/WI in Non-secure state. See *Enabling Non-secure access to SIMD and floating-point functionality* on page G1-5354.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

For more information about SIMD and floating-point support, see *Advanced SIMD and floating-point support* on page G1-5316.

Enabling access to the SIMD and floating-point registers

FPEXC.EN enables accesses to the SIMD and floating-point registers at all Exception levels, but does not control the following:

- `VMSR` accesses to the FPEXC or FPSID.
- `VMRS` accesses from the FPEXC, FPSID, MVFR0, MVFR1, or MVFR2.

When FPEXC.EN is:

1 Accesses to the registers shown in Table G1-28 are enabled at all Exception levels.

0 All accesses to the registers shown in Table G1-28 are UNDEFINED.

Table G1-28 shows the registers for which accesses are enabled, and for an exception taken to Hyp mode, how the exception is reported in HSR.

Table G1-28 Register accesses enabled when FPEXC.EN is 1

Enabled at	Registers	Syndrome reporting in HSR[a]
All Exception levels	FPSCR, and any of the SIMD and floating-point registers Q0-Q15, including their views as D0-D31 registers or S0-S31 registers.	Exception for an unknown reason, using EC value `0x00`

a. Only for exceptions that are taken to Hyp mode.

For more information, see *Advanced SIMD and floating-point support* on page G1-5316.

Disabling PL0 and PL1 execution of Advanced SIMD instructions

If implemented as an RW field, CPACR.ASEDIS can disable PL0 and PL1 execution of Advanced SIMD instructions, as follows:

1 Advanced SIMD instructions are UNDEFINED at PL0 and PL1.

0 Advanced SIMD instruction execution is enabled at PL0 and PL1.

The instructions that CPACR.ASEDIS disables are those described in *Controls of Advanced SIMD operation that do not apply to floating-point operation* on page E1-3554.

When the control is not implemented, meaning the CPACR.ASEDIS field is RAZ/WI, behavior is as if the control permits execution of Advanced SIMD instructions at PL0 and PL1.

If EL3 is implemented and is using AArch32, and NSACR.NSASEDIS is 1, CPACR.ASEDIS is RAO/WI in Non-secure state. This also applies when the CPACR.ASEDIS control is not implemented.

Traps to Undefined mode of EL0 accesses to the Debug Communications Channel (DCC) registers

DBGDSCRext.UDCCdis traps EL0 accesses to the DCC registers to Undefined mode:

1 EL0 accesses to the DCC registers are trapped to Undefined mode

0 This control has no effect on EL0 accesses to the DCC registers.

Traps of EL0 accesses to the DBGDTRRXint and DBGDTRTXint are ignored in Debug state.

Table G1-29 shows the registers for which accesses are trapped.

Table G1-29 Register accesses trapped to Undefined mode when DBGDSCRext.UDCCdis is 1

Traps from	Registers
EL0	DBGDSCRint, DBGDTRRXint, DBGDTRTXint, DBGDIDR, DBGDSAR, DBGDRAR

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Note

All accesses to these registers are trapped, including `LDC` and `STC` accesses to DBGDTRTXint and DBGDTRRXint, and `MRRC` accesses to DBGDSAR and DBGDRAR.

When generated in Non-secure User mode, an exception generated by this control can be routed to EL2, as described in *Routing exceptions from Non-secure EL0 to EL2* on page G1-5262.

Traps to Undefined mode of EL0 accesses to the Generic Timer registers

CNTKCTL.{PL0PTEN, PL0VTEN, PL0PCTEN, PL0VCTEN} trap EL0 accesses to the Generic Timer registers to Undefined mode, as follows:

- CNTKCTL.PL0PTEN traps EL0 accesses to the physical timer registers.
- CNTKCTL.PL0VTEN traps EL0 accesses to the virtual timer registers.
- CNTKCTL.PL0PCTEN traps EL0 accesses to the frequency register and physical counter register.
- CNTKCTL.PL0VCTEN traps EL0 accesses to the frequency register and virtual counter register.

For all of these controls:

1 This control has no effect on EL0 accesses to the corresponding registers.

0 EL0 accesses to the corresponding registers are trapped to Undefined mode.

Accesses to the frequency register, CNTFRQ, are only trapped if CNTKCTL.PL0PCTEN and CNTKCTL.PL0VCTEN are both 0.

Table G1-30 shows the registers for which accesses are trapped.

Table G1-30 Register accesses trapped to Undefined mode by CNTKCTL trap controls

Traps from	Trap control	Registers
EL0	PL0PTEN	CNTP_CTL, CNTP_CVAL, CNTP_TVAL
	PL0VTEN	CNTV_CTL, CNTV_CVAL, CNTV_TVAL
	PL0PCTEN	CNTFRQ, CNTPCT
	PL0VCTEN	CNTFRQ, CNTVCT

When generated in Non-secure User mode, an exception generated by this control can be routed to EL2, as described in *Routing exceptions from Non-secure EL0 to EL2* on page G1-5262.

Traps to Undefined mode of EL0 accesses to Performance Monitors registers

PMUSERENR.{ER, CR, SW, EN} trap EL0 accesses to the Performance Monitors registers to Undefined mode. For each of these controls:

1 This control has no effect on EL0 accesses to the corresponding registers.

0 EL0 accesses to the corresponding registers are trapped to Undefined mode.

For those Performance Monitors registers that more than one PMUSERENR.{ER, CR, SW, EN} control applies to, accesses are only trapped if all controls that apply are set to 0.

The accesses that these trap controls trap might be reads, writes, or both.

Note

- The architecture does not provide traps on Performance Monitors register accesses through the memory-mapped external debug interface.
- If the Performance Monitors Extension is not implemented, the Performance Monitors registers, including PMUSERENR, are reserved.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Table G1-31 shows the registers for which EL0 accesses are trapped. For each register, the table shows the type of access trapped.

Table G1-31 Register accesses trapped to Undefined mode when disabled from EL0

Traps from	Trap control	Registers	Access type
EL0	ER	PMXEVCNTR, PMEVCNTR<n>	R
		PMSELR	RW
	CR	PMCCNTR, accessed using an MRC	R
	CR	PMCCNTR, accessed using an MRRC	R
	SW	PMSWINC	W
	EN	PMCNTENSET, PMCNTENCLR, PMCR, PMOVSR, PMSWINC, PMSELR, PMCEID0, PMCEID1, PMCEID2, PMCEID3, PMCCNTR, PMXEVTYPER, PMXEVCNTR, PMOVSSET, PMEVCNTR<n>, PMEVTYPER<n>, PMCCFILTR	RW[a]

a. The EL0 access is trapped only if the corresponding EL1 accesses is permitted. For example, the PMSWINC register is WO at EL1, and therefore, when the value of EN is 0:
- Write accesses to the register from EL0 are trapped.
- Read accesses to the register from EL0 are UNDEFINED, because read accesses to the register from EL1 are UNDEFINED.

When generated in Non-secure User mode, an exception generated by this control can be routed to EL2, as described in *Routing exceptions from Non-secure EL0 to EL2* on page G1-5262.

Traps to Undefined mode of EL0 accesses to Activity Monitors registers

AMUSERENR.EN traps EL0 accesses to the Activity Monitors System registers other than AMUSERENR to Undefined mode:

1 This control has no effect on EL0 accesses to the corresponding registers.

0 EL0 accesses to the corresponding registers are trapped to Undefined mode.

Note

- The architecture does not provide traps on Activity Monitors register accesses through the memory-mapped external interface.
- If the Activity Monitors Extension is not implemented, the Activity Monitors registers, including AMUSERENR, are reserved.

Table G1-32 shows the registers for which EL0 accesses are trapped.

Table G1-32 Register accesses trapped to Undefined mode when disabled from EL0

Traps from	Registers
EL0	AMCFGR, AMCGCR, AMCNTENCLR0, AMCNTENCLR1, AMCNTENSET0, AMCNTENSET1, AMCR, AMEVTYPER0<n>, AMEVTYPER1<n>, AMEVCNTR0<n> or AMEVCNTR1<n>.

When generated in Non-secure User mode, an exception generated by this control can be routed to EL2, as described in *Routing exceptions from Non-secure EL0 to EL2* on page G1-5262.

G1.21.3 EL2 configurable controls

These controls are ignored in Secure state when using AArch32.

Table G1-33 shows the System registers that contain these controls.

Table G1-33 System registers that contain instruction enables and disables, and trap controls

Register name	Register description
FPEXC	Floating-point Exception Control Register
HCR	Hypervisor Configuration Register
HSTR	Hypervisor System Trap Register
HCPTR	Hyp Architectural Feature Trap Register
HDCR	Hyp Debug Control Register

Note

- FPEXC.EN is a control that is in a System register provided by PL1. However, some exceptions generated because the value of FPEXC.EN is 1 are taken to Hyp mode.
- For completeness, Table G1-34 includes the HCR.TGE routing control, that is described in *Routing exceptions from Non-secure EL0 to EL2* on page G1-5262.

Table G1-34 summarizes the controls.

Table G1-34 Instruction enables and disables, and trap controls, for exceptions taken to Hyp mode

Instructions that fail their Condition code check

For UNDEFINED instructions that fail their Condition code check, see *Conditional execution of undefined instructions* on page G1-5284.

For an instruction that has a Hyp trap set, that fails its Condition code check:

- Unless the trap description states otherwise, it is IMPLEMENTATION DEFINED whether the instruction:
  - Generates a Hyp Trap exception.
  - Executes as a NOP.

Any implementation must be consistent in its handling of instructions that fail their Condition code check. This means that:

- Whenever a Hyp trap is set on an instruction it must either:
  - Always generate a Hyp Trap exception.
  - Always treat the instruction as a NOP.
- The IMPLEMENTATION DEFINED part of the requirements of *Conditional execution of undefined instructions* on page G1-5284 must be consistent with the handling of Hyp traps on instructions that fail their Condition code check. Table G1-36 shows this:

Table G1-36 Consistent handling of instructions that fail their Condition code check

Behavior of conditional UNDEFINED instruction[a]	Hyp trap on instruction that fails its Condition code check[b]
Executes as a NOP	Executes as a NOP
Generates an Undefined Instruction exception	Generates a Hyp Trap exception

a. As defined in *Conditional execution of undefined instructions* on page G1-5284. In Non-secure EL0 and EL1 modes, this applies only if no Hyp trap is set for the instruction, otherwise see the behavior in the other column of the table.

b. For a trapped instruction executed in a Non-secure EL1 or EL0 mode.

Note

Hyp traps on WFE and WFI instructions generate Hyp Trap exceptions only if the instruction passes its Condition code check. See *Traps to Hyp mode of Non-secure EL0 and EL1 execution of WFE and WFI instructions* on page G1-5341.

Trapping to EL2 of instructions that are UNPREDICTABLE

For an instruction that is UNPREDICTABLE or CONSTRAINED UNPREDICTABLE, when the instruction is disabled or trapped then it is CONSTRAINED UNPREDICTABLE whether execution of the instruction generates a Hyp Trap exception.

Note

UNPREDICTABLE and CONSTRAINED UNPREDICTABLE behavior must not perform any function that cannot be performed at the current or lower Exception level using instructions that are not UNPREDICTABLE and are not CONSTRAINED UNPREDICTABLE. This means that disabling or trapping an instruction changes the set of instructions that might be executed in Non-secure state at EL1 or EL0. This indirectly affects the permitted behavior of UNPREDICTABLE and CONSTRAINED UNPREDICTABLE instructions.

If no instructions are trapped, the attempted execution of an UNPREDICTABLE instruction in a Non-secure EL1 or EL0 mode must not generate a Hyp Trap exception.

Disabling or enabling EL2 use of AArch32 deprecated functionality

Table G1-37 shows the deprecated AArch32 functionality that might have disable controls in the HSCTLR:

- The SED control is always implemented.
- Whether each of the ITD, CP15BEN controls is implemented is IMPLEMENTATION DEFINED. If a control is not implemented, then the associated functionality cannot be disabled.

These HSCTLR controls apply only to execution at EL2 using AArch32. When an instruction is disabled by one of these controls, it is UNDEFINED at EL2, meaning it is undefined in Hyp mode.

Table G1-37 EL2 controls for disabling and enabling EL2 use of AArch32 deprecated functionality

Deprecated AArch32 functionality	Instruction enable or disable in the HSCTLR	Disabled instructions
SETEND instructions	SED[a]	SETEND instructions
Some uses of IT instructions	ITD[b]	See the HSCTLR.IT description
Accesses to the System register (coproc==0b1111) DMB, DSB, and ISB barrier operations	CP15BEN[c]	MCR accesses to the CP15DMB, CP15DSB, and CP15ISB

a. SETEND instruction disable. SETEND instructions are disabled when the value of this field is 1.
b. IT instruction disable. If this control is implemented, some uses of IT instructions are disabled when the value of this field is 1.
c. System register (coproc==0b1111) memory barrier enable. If this control is implemented, the specified register accesses are disabled when the value of CP15BEN is 0.

Note

- These controls have no effect on instructions executed in any mode other than Hyp mode. The SCTLR provides similar controls that apply to execution in other modes.
- The uses of the IT instruction, and use of the CP15DMB, CP15DSB, and CP15ISB barrier instructions, are deprecated for performance reasons.

Traps to Hyp mode of Non-secure EL1 accesses to virtual memory control registers

HCR.{TRVM, TVM} trap Non-secure EL1 accesses to the virtual memory control registers to Hyp mode:

HCR.TRVM, for read accesses:

1 Non-secure EL1 reads of the virtual memory control registers are trapped to Hyp mode.

0 This control has no effect on Non-secure EL1 reads of the virtual memory control registers.

HCR.TVM, for write access:

1 Non-secure EL1 writes to the virtual memory control registers are trapped to Hyp mode.

0 This control has no effect on Non-secure EL1 writes to the virtual memory control registers.

Table G1-38 on page G1-5335 shows the registers for which:

- Reads are trapped to Hyp mode when HCR.TRVM is 1.
- Writes are trapped to Hyp mode when HCR.TVM is 1.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

The table also shows how the exceptions are reported in HSR.

Table G1-38 Register read and write accesses trapped when HCR.{TRVM, TVM} are 1

Traps from	Registers	Syndrome reporting in HSR
Non-secure EL1	SCTLR, TTBR0, TTBR1, TTBCR, TTBCR2, DACR, DFSR, IFSR, DFAR, IFAR, ADFSR, AIFSR, PRRR, NMRR, MAIR0, MAIR1, AMAIR0, AMAIR1, CONTEXTIDR	Trapped MCR or MRC access (coproc==0b1111), using EC value 0x03 Trapped MCRR or MRRC access (coproc==0b1111), using EC value 0x04

Note

These registers are not accessible at EL0.

Disabling Non-secure state execution of HVC instructions

HCR.HCD disables Non-secure state execution of HVC instructions:

1 HVC instructions are UNDEFINED at EL2 and Non-secure EL1. The Undefined Instruction exception is taken from the current Exception level to the current Exception level.

0 HVC instruction execution is enabled at EL2 and Non-secure EL1.

Note

HVC instructions are always UNDEFINED at EL0.

HCR.HCD is only implemented if EL3 is not implemented. Otherwise, it is RES0. See the HCR register description.

Table G1-39 shows how the exceptions are reported in HSR.

Table G1-39 Instruction that causes exceptions when HCR.HCD is 1

Attempted execution in	Disabled instruction	Syndrome reporting in HSR
Hyp mode	HVC	Exception for an unknown reason, using EC value 0x00
Mode other than Hyp mode	HVC	Not applicable

Traps to Hyp mode of Non-secure EL1 execution of TLB maintenance instructions

In the ARMv8-A architecture, the System instruction encoding space includes TLB maintenance instructions.

HCR.TTLB traps Non-secure EL1 execution of TLB maintenance instructions to Hyp mode:

1 Any attempt to execute a TLBI instruction at Non-secure EL1 is trapped to Hyp mode.

0 This control has no effect on the Non-secure EL1 execution of TLBI instructions.

Table G1-40 shows the instructions that are trapped, and how the exceptions are reported in HSR.

Table G1-40 Instructions trapped to Hyp mode when HCR.TTLB is 1

Traps from	Trapped instructions	Syndrome reporting in HSR
Non-secure EL1	TLBIALLIS, TLBIMVAIS, TLBIASIDIS, TLBIMVAAIS, TLBIMVALIS, TLBIMVAALIS, ITLBIALL, ITLBIMVA, ITLBIASID, DTLBIALL, DTLBIMVA, DTLBIASID, TLBIALL, TLBIMVA, TLBIASID, TLBIMVAA, TLBIMVAL, TLBIMVAAL.	Trapped MCR or MRC access (coproc==0b1111), using EC value 0x03

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Note

These instructions are always UNDEFINED at EL0.

For more information about these instructions, see *The scope of TLB maintenance instructions* on page G5-5546.

Traps to Hyp mode of Non-secure EL1 execution of cache maintenance instructions

HCR.{TSW, TPC, TPU} trap cache maintenance instructions to Hyp mode:

0 The control has no effect on the execution of cache maintenance instructions.

1 Any attempt to execute one of the cache maintenance instructions shown in Table G1-42 at Non-secure EL1 is trapped to Hyp mode.

Table G1-41 Controls for trapping cache maintenance instructions to Hyp mode

Trap control	Trapped instructions
HCR.TSW	Data or unified cache maintenance by set/way
HCR.TPC	Data or unified cache maintenance to point of coherency
HCR.TPU	Cache maintenance to point of unification

Table G1-42 shows the instructions that are trapped to Hyp mode, and how the exceptions are reported in HSR.

Table G1-42 Instructions trapped to Hyp mode when HCR.{TSW, TPC, TPU} are 1

Traps from	Trap control	Trapped instructions	Syndrome reporting in HSR
Non-secure EL1	TSW	DCISW, DCCSW, DCCISW	Trapped `MCR` or `MRC` access (`coproc==0b1111`), using EC value `0x3`
	TPC	DCIMVAC, DCCIMVAC, DCCMVAC	
	TPU	ICIMVAU, ICIALLU, ICIALLUIS, DCCMVAU	

Note

These instructions are always UNDEFINED at EL0.

For more information about these instructions, see *Cache maintenance system instructions* on page K13-7437.

Traps to Hyp mode of Non-secure EL1 accesses to the Auxiliary Control Register

HCR.TAC traps Non-secure EL1 accesses to the Auxiliary Control Registers to Hyp mode:

1 Non-secure EL1 accesses to the Auxiliary Control Registers are trapped to Hyp mode.

0 This control has no effect on Non-secure EL1 accesses to the Auxiliary Control Registers.

Table G1-43 shows the registers for which accesses are trapped, and how the exceptions are reported in HSR:

Table G1-43 Register accesses trapped to Hyp mode when HCR.TAC is 1

Traps from	Registers	Syndrome reporting in HSR
Non-secure EL1	ACTLR and, if implemented, ACTLR2.	Trapped `MCR` or `MRC` access (`coproc==0b1111`) access, using EC value `0x03`

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Note

The ACTLR and ACTLR2 are not accessible at EL0.

Traps to Hyp mode of Non-secure EL0 and EL1 accesses to lockdown, DMA, and TCM operations

The lockdown, DMA, and TCM features of the ARMv8-A architecture are IMPLEMENTATION DEFINED. The architecture reserves the encodings of a number of System registers for control of these features.

HCR.TIDCP traps the execution of System register access instructions that access these registers, as follows:

1 At Non-secure EL1, any attempt to execute an `MCR` or `MRC` instruction with a reserved register encoding shown in Table G1-44 is trapped to Hyp mode.

At Non-secure EL0, it is IMPLEMENTATION DEFINED whether attempts to execute `MCR` or `MRC` instructions with reserved register encodings are:

- Trapped to Hyp mode.
- UNDEFINED, and the PE takes the Undefined Instruction exception to Non-secure Undefined mode.

Any lockdown fault in the memory system caused by the use of these operations in Non-secure state generates a Data Abort exception that is taken to Hyp mode.

0 This control has no effect on Non-secure EL0 and EL1 System register access instructions with reserved register encodings shown in Table G1-44.

Note

This means that a Hyp Trap exception taken from Non-secure EL1 to Hyp mode, generated because of a configuration setting in HCR.TIDCP is a higher priority exception than an Undefined Instruction exception generated because either the System register encoding is unallocated or because the register is never accessible at EL1. As *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5251 shows, this is an exception to the general exception prioritization rules, that prioritize most Undefined Instruction exceptions taken to Undefined mode above traps to EL2.

Table G1-44 shows the register encodings for which accesses are trapped to Hyp mode, and how the exceptions are reported in HSR.

Table G1-44 Encodings trapped to Hyp mode when HCR.TIDCP is 1

Traps from	Register encodings	Syndrome reporting in HSR
Non-secure EL0 and EL1	An access to any of the following encodings: • CRn==c9, opc1=={0-7}, CRm=={c0-c2, c5-c8}, opc2=={0-7}. • CRn==c10, opc1=={0-7}, CRm=={c0, c1, c4, c8}, opc2=={0-7}. • CRn==c11, opc1=={0-7}, CRm=={c0-c8, c15}, opc2=={0-7}.	Trapped `MCR` or `MRC` access (`coproc==0b1111`), using EC value `0x03`

An implementation can also include IMPLEMENTATION DEFINED registers that provide additional controls, to give finer-grained control of the trapping of IMPLEMENTATION DEFINED features.

Note

ARM expects the trapping of Non-secure User mode accesses to these functions to Hyp mode to be unusual, and used only when the hypervisor is virtualizing User mode operation. ARM strongly recommends that unless the hypervisor must virtualize User mode operation, a Non-secure User mode access to any of these functions generates an Undefined Instruction exception, as it would if the implementation did not include EL2. The PE then takes this exception to Non-secure Undefined mode.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Traps to Hyp mode of Non-secure EL1 execution of SMC instructions

HCR.TSC traps Non-secure EL1 execution of SMC instructions to Hyp mode:

1 Any attempt to execute an SMC instruction at Non-secure EL1 is trapped to Hyp mode, regardless of the value of SCR.SCD.

0 This control has no effect on Non-secure EL1 execution of SMC instructions.

Table G1-45 shows how the exceptions are reported in HSR:

Table G1-45 SMC Instruction trapped to Hyp mode when HCR.TSC is 1

Traps from	Trapped instruction	Syndrome reporting in HSR
Non-secure EL1	*SMC on page F5-4266*	Trapped SMC instruction execution in AArch32 state, using EC value 0x13

The ARMv8-A architecture permits, but does not require, this trap to apply to conditional SMC instructions that fail their Condition code check, in the same way as with traps on other conditional instructions.

Note

- This trap is implemented only if the implementation includes EL3.
- SMC instructions are always UNDEFINED at EL0.
- HCR.TSC traps execution of the SMC instruction. It is not a routing control for the SMC exception. Hyp Trap and SMC exceptions have different preferred return addresses.

For more information about SMC instructions, see *SMC on page F5-4266*.

Traps to Hyp mode of Non-secure EL0 and EL1 accesses to the ID registers

Other than the MIDR, MPIDR, and PMCR.N, the ID registers are divided into groups, with a trap control in the HCR for each group.

Table G1-46 ID register groups

Trap control	Register group
HCR.TID0	*ID group 0, Primary device identification registers* on page G1-5339
HCR.TID1	*ID group 1, Implementation identification registers* on page G1-5340
HCR.TID2	*ID group 2, Cache identification registers* on page G1-5340
HCR.TID3	*ID group 3, Detailed feature identification registers* on page G1-5340

These controls trap register accesses from Non-secure EL0 or EL1 to Hyp mode, as follows:

HCR.TID0
0 This control has no effect on Non-secure EL1 reads of the ID group 0 registers.
1 Any attempt at Non-secure EL0 or EL1 to read any register in ID group 0 is trapped to Hyp mode.

HCR.TID1
0 This control has no effect on Non-secure EL1 reads of the ID group 1 registers.
1 Any attempt at Non-secure EL1 to read any register in ID group 1 is trapped to Hyp mode.

HCR.TID2
0 This control has no effect on Non-secure EL1 and EL0 accesses to the ID group 2 registers.
1 Any attempt at Non-secure EL0 or EL1 to read any register in ID group 2, and any attempt at Non-secure EL0 or EL1 to write to the CSSELR, is trapped to Hyp mode.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

HCR.TID3	**0**	This control has no effect on Non-secure EL1 reads of the ID group 3 registers.
	1	Any attempt at Non-secure EL1 to read any register in ID group 3 is trapped to Hyp mode.

For the MIDR and MPIDR, and for PMCR.N, the architecture provides read/write aliases. The original register becomes accessible only from Hyp mode and Secure state, and a Non-secure EL0 or EL1 read of the original register returns the value of the read/write alias. This substitution is invisible to the EL0 or EL1 software reading the register.

Table G1-47 ID register substitution

Register	Original	Alias, EL2 using AArch32
Main ID	MIDR	VPIDR
Multiprocessor Affinity	MPIDR	VMPIDR
Performance Monitors Control Register	PMCR.N	HDCR.HPMN

Reads of the MIDR, MPIDR, or PMCR.N from Hyp mode or Secure state are unchanged by the implementation of EL2, and access the physical registers.

Note

- If the optional Performance Monitors Extension is not implemented, HDCR.HPMN is RES0 and PMCR is reserved.
- HDCR.HPMN also affects whether a Performance Monitors counter can be accessed from Non-secure EL1 or EL0. See the register description of HDCR for more information.
- PMCR contains other fields that identify the implementation. For more information about trapping accesses to the PMCR, see *Traps to Hyp mode of Non-secure EL0 and EL1 accesses to Performance Monitors registers* on page G1-5349.

A reset into AArch32 state sets VPIDR to the MIDR value, VMPIDR to the MPIDR value, and HDCR.HPMN to the PMCR.N value.

ID group 0, Primary device identification registers

These registers identify some top-level implementation choices.

Table G1-48 shows the registers that are in ID group 0 for traps to Hyp mode, and how the exceptions are reported in HSR.

Table G1-48 ID group 0 registers

Traps from	Group 0 registers	Syndrome reporting in HSR
Non-secure EL1	FPSID	Trapped `VMRS` access, for ID group traps, using EC value `0x08`
Non-secure EL0 and EL1	JIDR	Trapped `MCR` or `MRC` access (`coproc==0b1110`), using EC value `0x05`

Note

The FPSID is not accessible at EL0.

If HCPTR.{TCP11, TCP10} traps accesses to SIMD and floating-point functionality, then for a read of FPSID, that trap has priority over this trap.

When the FPSID is accessible, a `VMSR FPSID, <Rt>` instruction is permitted but is ignored. The execution of this `VMSR` instruction is not trapped by the ID group 0 trap.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

ID group 1, Implementation identification registers

These registers often provide coarse-grained identification mechanisms for implementation-specific features.

Table G1-49 shows the registers that are in ID group 1 for traps to Hyp mode, and how the exceptions are reported in HSR.

Table G1-49 ID group 1 registers

Traps from	Group 1 registers	Syndrome reporting in HSR
Non-secure EL1	TCMTR, TLBTR, REVIDR, AIDR	Trapped `MCR` or `MRC` access (`coproc==0b1111`), using EC value `0x03`

ID group 2, Cache identification registers

These registers describe and control the cache implementation.

Table G1-50 shows the registers that are in ID group 2 for traps to Hyp mode, and how the exceptions are reported in HSR.

Table G1-50 ID group 2 registers

Traps from	Group 2 registers	Syndrome reporting in HSR
Non-secure EL0 and EL1	CTR, CCSIDR, CLIDR, CSSELR, and, if implemented, CCSIDR2.	Trapped `MCR` or `MRC` access (`coproc==0b1111`), using EC value `0x03`

ID group 3, Detailed feature identification registers

These registers provide detailed information about the features of the implementation.

Note

These registers are called the CPUID registers. There is no requirement for this trap to apply to those registers that the CPUID Identification Scheme defines as reserved. See The CPUID identification scheme on page G4-4993.

Table G1-51 shows the registers that are in ID group 3 for traps to Hyp mode, and how the exceptions are reported in HSR.

Table G1-51 ID group 3 registers

Traps from	Group 3 registers	Syndrome reporting in HSR
Non-secure EL1	MVFR0, MVFR1, MVFR2.	Trapped `VMRS` access for ID group traps, using EC value `0x08`
	ID_PFR0, ID_PFR1, ID_DFR0, ID_AFR0. ID_MMFR0, ID_MMFR1, ID_MMFR2, ID_MMFR3, and ID_MMFR4, except that if ID_MMFR4 is implemented as RAZ/WI then it is IMPLEMENTATION DEFINED whether reads of the register are trapped. ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, ID_ISAR4, ID_ISAR5. Any `MRC` access to any of the following encodings when `coproc==0b1111`: • `opc1` == 0, `CRn` == c0, `CRm` == {c3-c7}, `opc2` == {0, 1}. • `opc1` == 0, `CRn` == c0, `CRm` == c3, `opc2` == 2. • `opc1` == 0, `CRn` == c0, `CRm` == c5, `opc2` == {4, 5}. It is IMPLEMENTATION DEFINED whether HCR.TID3 traps `MRC` accesses with `coproc==0b1111` to encodings in the following range that are not already mentioned in this table: • `CRn` == c0, `opc1` == 0, `CRm` == {c2-c7}, `opc2` == {0-7}.	Trapped `MCR` or `MRC` access (`coproc==0b1111`), using EC value `0x03`

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

If HCPTR traps accesses to SIMD and floating-point functionality, then for reads of MVFR0, MVFR1, and MVFR2, that trap has priority over this trap.

Traps to Hyp mode of Non-secure EL0 and EL1 execution of WFE and WFI instructions

HCR.{TWE, TWI} trap Non-secure EL0 and EL1 execution of WFE and WFI instructions to Hyp mode:

HCR.TWE:

1 Any attempt to execute a WFE instruction at Non-secure EL0 or EL1 is trapped to Hyp mode, if the instruction would otherwise have caused the PE to enter a low-power state.

0 This control has no effect on Non-secure EL0 or EL1 execution of WFE instructions.

HCR.TWI:

1 Any attempt to execute a WFI instruction at Non-secure EL0 or EL1 is trapped to Hyp mode, if the instruction would otherwise have caused the PE to enter a low-power state.

0 This control has no effect on Non-secure EL0 or EL1 execution of WFI instructions.

Table G1-52 shows how the exceptions are reported in HSR.

Table G1-52 Instructions trapped to Hyp mode when HCR.{TWE, TWI} are 1

Traps from	Trapped instructions	Syndrome reporting in HSR
Non-secure EL0 and EL1	WFE	Trapped WFI or WFE instruction, using EC value 0x01
	WFI	

The attempted execution of a conditional WFE or WFI instruction is only trapped if the instruction passes its Condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

For more information about these instructions, and when they can cause the PE to enter a low-power state, see:

- *Wait For Event and Send Event* on page G1-5308.
- *Wait For Interrupt* on page G1-5311.

Traps to Hyp mode of Non-secure EL0 and EL1 accesses to Activity Monitors registers

If the Activity Monitors Extension is implemented, HCPTR.TAM traps Non-secure EL0 and EL1 accesses to the Activity Monitors registers to Hyp mode:

1 Non-secure EL0 and EL1 accesses to all Activity Monitors registers are trapped to Hyp mode.

0 This control has no effect on Non-secure EL0 and EL1 accesses to the Activity Monitors registers.

Note

- EL2 does not provide traps on Activity Monitor register accesses through the optional memory-mapped external interface.
- If the Activity Monitors Extension is not implemented, HCPTR.TAM is RES0.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Table G1-53 shows the registers for which accesses are trapped, and how the exceptions are reported in HSR.

Table G1-53 Register accesses trapped to Hyp mode when HDCR.{TPM, TPMCR} are 1

Traps from	Trap control	Registers	Syndrome reporting in HSR
Non-secure EL0 and EL1	TPM	AMCFGR, AMCGCR, AMCNTENCLR0, AMCNTENCLR1, AMCNTENSET0, AMCNTENSET1, AMCR, AMEVTYPER0<n>, or AMEVTYPER1<n>.	Trapped MCR or MRC access (coproc==0b1111), using EC value 0x03.
		AMEVCNTR0<n>or AMEVCNTR1<n>.	Trapped MCRR or MRRC access (coproc==0b1111), using EC value 0x04.

General trapping to Hyp mode of Non-secure accesses to the SIMD and floating-point registers

HCPTR.{TCP11, TCP10} trap Non-secure accesses to the SIMD and floating-point registers to Hyp mode:

0b11 All Non-secure accesses to the SIMD and floating-point registers are trapped to Hyp mode. Trapped instructions generate:
- Hyp Trap exceptions, if the exception is taken from Non-secure EL0 or EL1.
- Undefined Instruction exceptions taken to Hyp mode, if the exception is taken from EL2.

0b00 This control has no effect on Non-secure accesses to the SIMD and floating-point registers.

Note

Software must set HCPTR.TCP11 and HCPTR.TCP10 to the same value.

Table G1-54 shows the registers for which accesses are trapped, and how the exceptions are reported in HSR.

Table G1-54 Register accesses trapped to Hyp mode when HCPTR.{TCP11, TCP10} are both 0b11

Traps from	Registers	Syndrome reporting in HSR
Non-secure state	FPSID, MVFR0, MVFR1, MVFR2, FPSCR, FPEXC, and any of the SIMD and floating-point registers Q0-Q15, including their views as D0-D31 registers or S0-S31 registers. See *Advanced SIMD and floating-point System registers* on page G1-5318.	Trapped access to SIMD and floating-point register, resulting from HCPTR, using EC value 0x07[a]

a. VMSR accesses to the FPSID are ignored, but for the purposes of this trap the architecture defines a VMSR access to the FPSID from EL1 or higher as an access to a SIMD and floating-point register.

If EL3 is implemented and is using AArch32, and NSACR.{cp11, cp10} are both set to 0, then HCPTR.{TCP11, TCP10} behave as RAO/WI, regardless of their actual value.

For more information about SIMD and floating-point support, see *Advanced SIMD and floating-point support* on page G1-5316.

Enabling access to the SIMD and floating-point registers

FPEXC.EN is an instruction enable that enables access to the SIMD and floating-point registers from all Exception levels, but does not control the following:
- VMSR accesses to the FPEXC or FPSID.
- VMRS accesses from the FPEXC, FPSID, MVFR0, MVFR1, or MVFR2.

FPEXC.EN is a PL1 control that also applies at EL2. See *Enabling access to the SIMD and floating-point registers* on page G1-5328.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Traps to Hyp mode of Non-secure accesses to Advanced SIMD functionality

If implemented as an RW field, HCPTR.TASE can trap Non-secure execution of Advanced SIMD instructions to Hyp mode, as follows. This trap applies only when HCPTR.{TCP11, TCP10} are both `0`:

1 Any attempt to execute an Advanced SIMD instruction in Non-secure state is trapped to Hyp mode. Trapped instructions generate:
- Hyp Trap exceptions, if the exception is taken from Non-secure EL0 or EL1.
- Undefined Instruction exceptions taken to Hyp mode, if the exception is taken from EL2.

0 This control has no effect on Non-secure execution of Advanced SIMD instructions.

When the control is not implemented, meaning the HCPTR.TASE field is RAZ/WI, the HCPTR does not provide a trap to Hyp mode of the Non-secure execution of Advanced SIMD instructions, other than the HCPTR.{TCP11, TCP10} trap that applies to Non-secure execution of both Advanced SIMD and floating-point instructions.

Table G1-27 on page G1-5327 shows the instructions that are trapped, and how the exceptions are reported in HSR.

Table G1-55 Instructions trapped to Hyp mode when HCPTR.TASE is set to 1

Traps from	Instructions	Syndrome reporting in HSR
Non-secure state	All Advanced SIMD instructions that are not also floating-point instructions. For more information, see *Controls of Advanced SIMD operation that do not apply to floating-point operation* on page E1-3554.	Trapped access to SIMD and floating-point register, resulting from HCPTR, using EC value `0x07`

If EL3 is implemented and is using AArch32, and NSACR.NSASEDIS is 1, then HCPTR.TASE behaves as RAO/WI, regardless of its actual value. This behavior also applies when the HCPTR.TASE control is not implemented.

Traps to Hyp mode of Non-secure EL1 accesses to the CPACR

HCPTR.TCPAC traps Non-secure EL1 accesses to the CPACR to Hyp mode:

1 Non-secure EL1 accesses to the CPACR are trapped to Hyp mode.

0 This control has no effect on Non-secure EL1 accesses to the CPACR.

Table G1-56 shows how the exceptions are reported in HSR:

Table G1-56 Register accesses trapped to Hyp mode when HCPTR.TCPAC is 1

Traps from	Register	Syndrome reporting in HSR
Non-secure EL1	CPACR	Trapped `MCR` or `MRC` access to System register with `coproc==0b1111`, using EC value `0x03`

Note

- The CPACR is not accessible at EL0.
- In ARMv7 and earlier versions of the ARM architecture, one use of the CPACR is to identify what coprocessor, or conceptual coprocessor, functionality is implemented. Legacy software might use this identification mechanism. A hypervisor can use this trap to emulate this mechanism. See *Background to the System register interface* on page G1-5314 for more information about this functionality.

Non-Confidential

Traps to Hyp mode of Non-secure System register accesses to trace registers

If implemented, the HCPTR.TTA control traps System register accesses to the trace registers from Non-secure state to Hyp mode, as follows:

1 Non-secure System register accesses to the trace registers are trapped to Hyp mode. Trapped instructions generate:
- Hyp Trap exceptions, if the exception is taken from Non-secure EL0 or EL1.
- Undefined Instruction exceptions taken to Hyp mode, if the exception is taken from EL2.

0 This control has no effect on Non-secure System register accesses to the trace registers.

If the HCPTR.TTA control is not implemented, then HCPTR.TTA is RAO/WI. See the register description for more information.

Note

- System register accesses to the trace registers use the System register (`coproc==0b1110`) encoding space.
- The ETMv4 architecture does not permit EL0 to access the trace registers. If the ARMv8-A architecture is implemented with an ETMv4 implementation, EL0 accesses to the trace registers are UNDEFINED. A resulting Undefined Instruction exception is higher priority than an HCPTR.TTA Hyp Trap exception.
- EL2 does not provide traps on trace register accesses through the optional memory-mapped external debug interface.

System register accesses to the trace registers can have side effects. When a System register access is trapped, no side effects occur before the exception is taken, see *Register access instructions* on page G1-5323.

Table G1-57 shows the registers for which accesses are trapped to Hyp mode when HCPTR.TTA is 1, and how the exceptions are reported in HSR.

Table G1-57 Register accesses trapped to Hyp mode when HCPTR.TTA is 1

Traps from	Registers	Syndrome reporting in HSR
Non-secure state	System register accesses to all implemented trace registers	For accesses using: • `MCR` or `MRC` instructions, trapped `MCR` or `MRC` access (`coproc==0b1110`), using EC value `0x05`. • `MCRR` or `MRRC` instructions, trapped `MCRR` or `MRRC` access (`coproc==0b1110`), using EC value `0x0C`.

If EL3 is implemented and is using AArch32, and NSACR.NSTRCDIS is 1, then HCPTR.TTA behaves as RAO/WI, regardless of its actual value. This behavior applies, also, when the HCPTR.TTA control is not implemented.

Traps to Hyp mode of Non-secure System register accesses to trace filter control registers

If implemented, the HDCR.TTRF control traps System register accesses to the trace filter control registers from Non-secure state to Hyp mode, as follows:

1 Non-secure System register accesses at EL1 to the trace filter control registers are trapped to Hyp mode. Trapped instructions generate Hyp Trap exceptions.

0 This control has no effect on Non-secure System register accesses to the trace registers.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Table G1-58 shows the registers for which accesses are trapped to Hyp mode when HDCR.TTRF is 1, and how the exceptions are reported in HSR.

Table G1-58 Register accesses trapped to Hyp mode when HDCR.TTRF is 1

Traps from	Registers	Syndrome reporting in HSR
Non-secure state	TRFCR	For accesses using MCR or MRC instructions, trapped MCR or MRC access (coproc==0b1111), using EC value 0x03.

General trapping to Hyp mode of Non-secure EL0 and EL1 accesses to System registers in the (coproc==0b1111) encoding space

HSTR.{T0-T3, T5-T13, T15} trap Non-secure EL0 and EL1 accesses, using MCR, MRC, MCRR, or MRRC instructions, to the System registers in the (coproc==0b1111) encoding space, by:

- The value of the CRn argument to the instruction, for MCR and MRC instructions.
- The value of the CRm argument to the instruction, for MCRR and MRRC instructions.

This applies for the set of CRn, or CRm, values {c0-c3, c5-c13, c15}.

When an HSTR.Tn trap control is:

1 Non-secure EL1 accesses to the corresponding System registers in the (coproc==0b1111) encoding space are trapped to Hyp mode.

EL0 accesses to the corresponding System registers are trapped to Hyp mode if they would not be UNDEFINED if the bit was zero.

0 This control has no effect on Non-secure EL0 or EL1 accesses to System registers.

Note

This means that a Hyp Trap exception taken from EL1 to EL2, generated because of a configuration setting in HSTR.Tn, is a higher priority exception than an Undefined Instruction exception generated because either the System register encoding is unallocated or because a register is never accessible at Non-secure EL1. As *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5251 shows, this is an exception to the general exception prioritization rules, that prioritize most Undefined Instruction exceptions taken to Undefined mode above traps to EL2. This prioritization includes any access from Non-secure EL1 to a register that is only accessible in Secure state. So, for example, an access to the SCR from Non-secure EL1:

- When the value of HSTR.T1 is 0, generates an Undefined Instruction exception.
- When the value of HSTR.T1 is 1, generates a Hyp Trap exception.

Table G1-59 shows the accesses that are trapped, and how the exceptions are reported in HSR.

Table G1-59 Accesses trapped to Hyp mode when an HSTR.Tn trap is enabled

Traps from	Trap control	Trapped accesses	Syndrome reporting in HSR
Non-secure EL0 and EL1[a]	Tn	MCR and MRC instructions, with coproc set to 0b1111 and CRn set to n	Trapped MCR or MRC access (coproc==0b1111), using EC value 0x03
		MCRR and MRRC instructions, with coproc set to 0b1111 and CRm set to n	Trapped MCRR or MRRC access (coproc==0b1111), using EC value 0x04

a. As described in this section, traps from EL1 apply whenever the value of HSTR.Tn is 1. Traps from EL0 apply only if the value of HSTR.Tn is 1 and the access would not be UNDEFINED if the value of HSTR.Tn was 0.

For example, when HSTR.T7 is 1, considering only accesses from Non-secure EL1:

- Any 32-bit access from a Non-secure PL1 mode using an MRC or MCR instruction with coproc set to 0b1111 and CRn set to c7, is trapped to Hyp mode.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

- Any 64-bit access from a Non-secure PL1 mode using an MRRC or MCRR instructions with coproc set to 0b1111 and CRm set to c7, is trapped to Hyp mode.

Note

- Bits[4,14] of the HSTR are reserved, RES0. Although the Generic Timer control registers are implemented in the coproc == 0b1111 encoding space with CRn==c14 for an MRC or MCR access, EL2 does not provide a trap on accesses to the Generic Timer System registers.
- An implementation might provide additional controls, in IMPLEMENTATION DEFINED registers, to provide finer-grained control of trapping of IMPLEMENTATION DEFINED features.

System registers in the (coproc==0b1111) encoding space with IMPLEMENTATION DEFINED access permission from EL0

For a System register in the (coproc==0b1111) encoding space, that is accessed using a CRn or CRm value that can be trapped by a HSTR.Tn control, if an access to the register from User mode is UNDEFINED when the value of the corresponding HSTR.Tn trap control is 0, then when that HSTR.Tn trap control is 1, it is IMPLEMENTATION DEFINED whether an access from Non-secure User mode generates:

- A Hyp Trap exception.
- An Undefined Instruction exception taken to Non-secure Undefined mode.

Note

ARM expects that trapping to Hyp mode of Non-secure User mode accesses to System register in the (coproc==0b1111) encoding space will be unusual, and used only when the hypervisor must virtualize User mode operation. ARM recommends that, whenever possible, Non-secure User mode accesses to System register in the (coproc==0b1111) encoding space behave as they would if the processor did not implement EL2, generating an Undefined Instruction exception taken to Non-secure Undefined mode if the architecture does not support the User mode access.

Traps to Hyp mode of Non-secure System register accesses to debug registers

HDCR.{TDRA, TDOSA, TDA} trap Non-secure System register accesses to debug registers to Hyp mode, as follows:

- HDCR.(TDRA, TDA} trap Non-secure EL0 and EL1 accesses.
- HDCR.TDOSA traps Non-secure EL1 accesses.

Note

EL2 does not provide traps of debug register accesses through the optional memory-mapped external debug interface.

System register accesses to the debug registers can have side effects. When a System register access is trapped to Hyp mode, no side effects occur before the exception is taken to Hyp mode. See *Register access instructions* on page G1-5323.

Table G1-60 shows the subsections that list the accesses trapped. The subsections describe how the traps are reported in HSR.

Table G1-60 Traps of Non-secure EL0 and EL1 accesses to debug registers

Trap control	Subsection
HDCR.TDRA	*Trapping Non-secure System register accesses to Debug ROM registers* on page G1-5347
HDCR.TDOSA	*Trapping Non-secure System register accesses to powerdown debug registers* on page G1-5347
HDCR.TDA	*Trapping general Non-secure System register accesses to debug registers* on page G1-5347

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Note

System register accesses to debug registers use the (coproc==0b1110) encoding space.

Trapping Non-secure System register accesses to Debug ROM registers

HDCR.TDRA traps Non-secure EL0 and EL1 System register accesses to the Debug ROM registers to Hyp mode:

1 Non-secure EL0 or EL1 System register accesses to the Debug ROM registers are trapped to Hyp mode.

0 This control has no effect on Non-secure EL0 and EL1 System register accesses to the Debug ROM registers.

Table G1-61 shows the register accesses that are trapped, and how the exceptions are reported in HSR:

Table G1-61 Register accesses trapped to Hyp mode when HDCR.TDRA is 1

Traps from	Registers	Syndrome reporting in HSR
Non-secure EL0 and EL1	DBGDRAR, DBGDSAR	For accesses using: • MCR or MRC instructions, trapped MCR or MRC access (coproc==0b1110), using EC value 0x05. • MRRC instructions, trapped MRRC access (coproc==0b1110), using EC value 0x0C.

If HDCR.TDE or HCR.TGE is 1, behavior is as if HDCR.TDRA is 1 other than for the purpose of a direct read.

Trapping Non-secure System register accesses to powerdown debug registers

HDCR.TDOSA traps Non-secure EL1 System register accesses to the powerdown debug registers to Hyp mode:

1 Non-secure EL1 System register accesses to the powerdown debug registers are trapped to Hyp mode.

0 This control has no effect on Non-secure EL1 System register accesses to the powerdown debug registers.

Table G1-62 shows the register accesses that are trapped, and how the exceptions are reported in HSR.

Table G1-62 Register accesses trapped to Hyp mode when HDCR.TDOSA is 1

Traps from	Registers	Syndrome reporting in HSR
Non-secure EL1	DBGOSLSR, DBGOSLAR, DBGOSDLR, DBGPRCR Any IMPLEMENTATION DEFINED integration registers. Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by HDCR.TDOSA.	Trapped MCR or MRC access (coproc==0b1110), using EC value 0x05

Note

These registers are not accessible at EL0.

If HDCR.TDE or HCR.TGE is 1, behavior is as if HDCR.TDOSA is 1 other than for the purpose of a direct read.

Trapping general Non-secure System register accesses to debug registers

HDCR.TDA traps Non-secure EL0 and EL1 System register accesses to the debug registers that are not mentioned in either of the following:

- *Traps to Hyp mode of Non-secure System register accesses to debug registers* on page G1-5346.
- *Trapping Non-secure System register accesses to powerdown debug registers*.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

This means that HDCR.TDA traps to Hyp mode Non-secure EL0 and EL1 System register accesses to all debug registers except the following:

- Non-secure System register accesses to DBGDRAR or DBGDSAR. The HDCR.TDRA trap traps these accesses.
- Non-secure System register access to DBGOSLSR, DBGOSLAR, DBGOSDLR, or DBGPRCR. The HDCR.TDOSA trap traps these accesses.

HDCR.TDA does not trap accesses to DBGDTRTXint or DBGDTRRXint when the PE is in Debug state.

When HDCR.TDA is:

1 Non-secure EL0 or EL1 System register accesses to any of the registers shown in Table G1-63 are trapped to Hyp mode.

0 This control has no effect on Non-secure EL0 or EL1 System register accesses.

Table G1-63 shows how the exceptions are reported in HSR.

Table G1-63 Accesses trapped to Hyp mode when HDCR.TDA is 1

Traps from	Trapped accesses	Syndrome reporting in HSR
Non-secure EL0 and EL1	Accesses to the DBGDIDR, DBGDSCRint, DBGDCCINT, DBGDTRRXint, DBGDTRTXint, DBGWFAR, DBGVCR, DBGDSCRext, DBGDTRTXext, DBGDTRRXext, DBGBVR<n>, DBGBCR<n>, DBGBXVR<n>, DBGWCR<n>, DBGWVR<n>, DBGCLAIMSET, DBGCLAIMCLR, DBGAUTHSTATUS, DBGDEVID, DBGDEVID1, DBGDEVID2, and DBGOSECCR	For accesses using `MCR` or `MRC` instructions, trapped `MCR` or `MRC` access (`coproc==0b1110`), using EC value `0x05`
	`STC` accesses to DBGDTRRXint. `LDC` accesses to DBGDTRTXint.	Trapped `LDC` or `STC` access, using EC value `0x06`

If HDCR.TDE or HCR.TGE is 1, behavior is as if HDCR.TDA is 1 other than for the purpose of a direct read.

Traps to Hyp mode of Non-secure EL0 and EL1 accesses to the Generic Timer registers

CNTHCTL.{PL1PCEN, PL1PCTEN} trap Non-secure EL0 and EL1 accesses to the Generic Timer registers to Hyp mode, as follows:

- CNTHCTL.PL1PCEN traps Non-secure EL0 and EL1 accesses to the physical timer registers.
- CNTHCTL.PL1PCTEN traps Non-secure EL0 and EL1 accesses to the physical counter register.

For each of these controls:

1 This control has no effect on Non-secure EL0 and EL1 accesses to the registers shown in Table G1-64 on page G1-5349.

0 Non-secure EL0 and EL1 accesses are trapped to Hyp mode.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Table G1-64 shows the registers for which accesses are trapped, and how the exceptions are reported in HSR.

Table G1-64 Register accesses trapped to Hyp mode by CNTHCTL trap controls

Traps from	Trap control	Registers	Syndrome reporting in HSR
Non-secure EL0 and EL1	PL1PCEN	CNTP_CTL, CNTP_CVAL, CNTP_TVAL	For accesses using: • MCR or MRC instructions, trapped MCR or MRC access (coproc==0b1111), using EC value 0x03 • MCRR or MRRC instructions, trapped MCRR or MRRC access (coproc==0b1111), using EC value 0x04
	PL1PCTEN	CNTPCT	Trapped MCRR or MRRC access (coproc==0b1110), using EC value 0x04

Traps to Hyp mode of Non-secure EL0 and EL1 accesses to Performance Monitors registers

If the Performance Monitors Extension is implemented, HDCR.{TPM, TPMCR} trap Non-secure EL0 and EL1 accesses to the Performance Monitors registers to Hyp mode:

HDCR.TPM:

1 Non-secure EL0 and EL1 accesses to all Performance Monitors registers are trapped to Hyp mode.

0 This control has no effect on Non-secure EL0 and EL1 accesses to the Performance Monitors registers.

HDCR.TPMCR:

1 Non-secure EL0 and EL1 accesses to the Performance Monitors Control Register are trapped to Hyp mode.

Note

The conditions for this trap are identical to those for the trap controlled by HDCR.TPM

0 This control has no effect on Non-secure EL0 and EL1 accesses to the Performance Monitors Control Registers.

Note

- EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.
- If the Performance Monitors Extension is not implemented, HDCR.{TPM, TPMCR} are RES0.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Table G1-65 shows the registers for which accesses are trapped, and how the exceptions are reported in HSR.

Table G1-65 Register accesses trapped to Hyp mode when HDCR.{TPM, TPMCR} are 1

Traps from	Trap control	Registers	Syndrome reporting in HSR
Non-secure EL0 and EL1	TPM	PMCR, PMCNTENSET, PMCNTENCLR, PMOVSR, PMSWINC, PMSELR, PMCEID0, PMCEID1, PMCCNTR, PMXEVTYPER, PMXEVCNTR, PMUSERENR, PMINTENSET, PMINTENCLR, PMOVSSET, PMEVCNTR<n>, PMEVTYPER<n>, PMCCFILTR	For accesses using: • MCR or MRC instructions, trapped MCR or MRC access (coproc==0b1111), using EC value 0x03. • MCRR or MRRC instructions, trapped MCRR or MRRC access (coproc==0b1111), using EC value 0x04.
	TPMCR	PMCR	Trapped MCR or MRC access (coproc==0b1111), using EC value 0x03

Note

HDCR.HPMN affects whether a counter can be accessed from Non-secure EL1 or EL0. See the register description of HDCR for more information.

Traps to Hyp mode of Non-secure EL1 accesses to the RAS error record registers

HCR2.TERR traps Non-secure EL1 accesses to the RAS ER* registers to Hyp mode. For more information on the RAS ER* registers, see the *ARM® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile*.

Table G1-66 Register accesses trapped to Hyp mode when HCR2.TERR is 1

Traps from	Trap control	Registers	Syndrome reporting in HSR
Non-secure EL0 and EL1	TERR	ERRIDR, ERRSELR, ERXADDR, ERXADDR2, ERXCTLR, ERXCTLR2, ERXFR, ERXFR2, ERXMISC0, ERXMISC1, ERXMISC2, ERXMISC3, ERXMISC4, ERXMISC5, ERXMISC6, ERXMISC7, ERXSTATUS.	For accesses using: • MCR or MRC instructions, trapped MCR or MRC access (coproc==0b1111), using EC value 0x03. • MCRR or MRRC instructions, trapped MCRR or MRRC access (coproc==0b1111), using EC value 0x04.

G1.21.4 EL3 configurable controls

Table G1-67 shows the System registers that contain these controls.

Table G1-67 System registers that contain instruction enables and disables, and trap controls

Register name	Register description
SCR	Secure Configuration Register
NSACR	Non-secure Access Control Register

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Table G1-68 summarizes the controls.

Table G1-68 EL3 Instruction enables and disables, and trap controls

Control	Type of control[a]	Trap
SCR.{TWE, TWI}	T	*Traps to Monitor mode of the execution of WFE and WFI instructions in modes other than Monitor mode* on page G1-5352
SCR.HCE	E	*Enabling EL2 and Non-secure EL1 execution of HVC instructions* on page G1-5353
SCR.SCD	D	*Disabling SMC instructions* on page G1-5353
NSACR.NSTRCDIS	D	*Disabling Non-secure System register access to the trace registers* on page G1-5354
SDCR.TTRF	T	*Traps to Monitor mode of System register accesses to the trace filter control registers* on page G1-5354
NSACR.{cp11, cp10}	E	*Enabling Non-secure access to SIMD and floating-point functionality* on page G1-5354
NSACR.NSASEDIS	D	*Disabling Non-secure access to Advanced SIMD functionality* on page G1-5355
SCR.TERR	T	*Traps to Monitor mode of accesses to RAS error record registers* on page G1-5353

a. See Table G1-69.

Table G1-69 Control types, for AArch32 EL3 controls

Abbreviation	Type	See
D	Disable	*Instruction enables and instruction disables* on page G1-5322
E	Enable	*Instruction enables and instruction disables* on page G1-5322
T	Trap	*Trap controls* on page G1-5322

Also see the following:

- *Register access instructions* on page G1-5323.
- *Instructions that fail their Condition code check*.
- *Trapping to EL3 of instructions that are UNPREDICTABLE* on page G1-5352.

Instructions that fail their Condition code check

For UNDEFINED instructions that fail their Condition code check, see *Conditional execution of undefined instructions* on page G1-5284.

For an instruction that has a Monitor trap set, that fails its Condition code check:

- Unless the trap description states otherwise, it is IMPLEMENTATION DEFINED whether the instruction:
  - Generates a Monitor Trap exception.
  - Executes as a `NOP`.

Any implementation must be consistent in its handling of instructions that fail their Condition code check. This means that:

- Whenever a Monitor trap is set on such an instruction it must either:
  - Always generate a Monitor trap exception.
  - Always treat the instruction as a `NOP`.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

- The IMPLEMENTATION DEFINED part of the requirements of *Conditional execution of undefined instructions on page G1-5284* must be consistent with the handling of Monitor traps on instructions that fail their Condition code check. Table G1-70 shows this:

Table G1-70 Consistent handling of instructions that fail their Condition code check

Behavior of conditional UNDEFINED instruction[a]	Monitor trap on instruction that fails its Condition code check[b]
Executes as a NOP	Executes as a NOP
Generates an Undefined Instruction exception	Generates a Monitor trap exception

a. As defined in *Conditional execution of undefined instructions on page G1-5284*. In Non-secure EL0 and EL1 modes, this applies only if no Monitor trap is set for the instruction, otherwise see the behavior in the other column of the table.

b. For a trapped instruction executed in a Non-secure EL1 or EL0 mode.

Note

When SCR{TWE, TWI} is set so that conditional WFE and WFI instructions are trapped to Monitor mode, the attempted execution of a conditional WFE or WFI instruction is only trapped if the instruction passes its Condition code check. See *Traps to Monitor mode of the execution of WFE and WFI instructions in modes other than Monitor mode*.

Trapping to EL3 of instructions that are UNPREDICTABLE

For an instruction that is UNPREDICTABLE, when the instruction is disabled or trapped then it is CONSTRAINED UNPREDICTABLE whether execution of the instruction generates a Monitor Trap exception.

Note

UNPREDICTABLE and constrained unpredictable behavior must not perform any function that cannot be performed at the current or lower Exception level using instructions that are not UNPREDICTABLE and are not constrained unpredictable. This means that disabling or trapping an instruction changes the set of instructions that might be executed in modes other than Monitor mode. This affects, indirectly, the permitted behavior of UNPREDICTABLE and constrained unpredictable instructions.

If no instructions are trapped, the attempted execution of an UNPREDICTABLE instruction in a mode other than Monitor mode must not generate a Monitor Trap exception.

Traps to Monitor mode of the execution of WFE and WFI instructions in modes other than Monitor mode

SCR{TWE, TWI} trap WFE and WFI instructions to Monitor mode:

SCR.TWE
- **1** Any attempt to execute a WFE instruction in any mode other than Monitor mode is trapped to Monitor mode, if the instruction would otherwise have caused the PE to enter a low-power state.
- **0** This control has no effect on the execution of WFE instructions.

SCR.TWI
- **1** Any attempt to execute a WFI instruction in any mode other than Monitor mode is trapped to Monitor mode, if the instruction would otherwise have caused the PE to enter a low-power state.
- **0** This control has no effect on the execution of WFI instructions.

For PL0 and PL1, these traps apply to WFE and WFI instruction execution in both Security states.

The attempted execution of a conditional WFE or WFI instruction is only trapped if the instruction passes its Condition code check.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

For more information about these instructions, and when they can cause the PE to enter a low-power state, see:

- *Wait For Event and Send Event* on page G1-5308.
- *Wait For Interrupt* on page G1-5311.

Traps to Monitor mode of accesses to RAS error record registers

SCR.TERR traps accesses to the RAS ER* registers from modes other than Monitor mode to Monitor mode.

Table G1-71 Register accesses trapped to EL3 when SCR.TERR is 1

Traps from	Registers	Syndrome reporting in ESR_EL3
AArch32 state	ERRIDR, ERRSELR, ERXADDR, ERXADDR2, ERXCTLR, ERXCTLR2, ERXFR, ERXFR2, ERXMISC0, ERXMISC1, ERXMISC2, ERXMISC3, ERXMISC4, ERXMISC5, ERXMISC6, ERXMISC7, ERXSTATUS.	For accesses using: • MCR or MRC instructions, trapped MCR or MRC access (coproc==0b1111), using EC value 0x03 • MCRR or MRRC instructions, trapped MCRR or MRRC access, (coproc==0b1111) using EC value 0x04

This trap control applies to accesses from both Security states.

Enabling EL2 and Non-secure EL1 execution of HVC instructions

SCR.HCE enables EL2 and Non-secure EL1 execution of HVC instructions:

1 HVC instruction execution is enabled at EL2 and Non-secure EL1.

0 HVC instructions are:

- UNDEFINED at Non-secure EL1. The Undefined Instruction exception is taken to Undefined mode.
- CONSTRAINED UNPREDICTABLE at EL2. The behavior must be one of the following:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.

Note

- If EL2 is not implemented, SCR.HCE is RES0 and HVC is UNDEFINED.
- HVC instructions are always UNDEFINED at EL0 and in Secure state.

Disabling SMC instructions

SCR.SCD disables SMC instructions:

1 **In Non-secure state**

SMC instructions are UNDEFINED. The Undefined Instruction exception is taken from the current Exception level to the current Exception level.

In Secure state

Behavior is one of the following:

- The instruction is UNDEFINED.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

- The instruction executes as a NOP.

0 SMC instructions are enabled.

Note

- SMC instructions are always UNDEFINED at EL0.
- When the value of HCR.TSC is 1, any attempted execution of an SMC instruction at Non-secure EL1 is trapped to EL2, regardless of the value of SCR.SCD, see *Traps to Hyp mode of Non-secure EL1 execution of SMC instructions* on page G1-5338. As *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5251 shows, this is an exception to the general exception prioritization rules, that prioritize most Undefined Instruction exceptions taken to Undefined mode above traps to a higher Exception level.

Disabling Non-secure System register access to the trace registers

NSACR.NSTRCDIS disables Non-secure System register accesses to the trace registers, from all Privilege levels:

1 Non-secure state accesses are disabled. Secure state accesses are enabled. If the PE is in Non-secure state:

- CPACR.TRCDIS behaves as RAO/WI, regardless of its actual value. See *Traps to Undefined mode of PL0 and PL1 System register accesses to trace registers* on page G1-5326.

  This behavior applies even if the CPACR.TRCDIS control is not implemented. See the referenced section for more information.
- HCPTR.TTA behaves as RAO/WI, regardless of its actual value. See *Traps to Hyp mode of Non-secure System register accesses to trace registers* on page G1-5344.

0 There is no effect on accesses to CPACR.TRCDIS and HCPTR.TTA.

Note

- System register accesses to the trace registers use the (coproc==0b1111) encoding space.
- NSACR.NSTRCDIS might be implemented as RAZ/WI. See the NSACR register description for more information.
- The ETMv4 architecture does not permit EL0 to access the trace registers. If the ARMv8-A architecture is implemented with an ETMv4 implementation, EL0 accesses to the trace registers are UNDEFINED.
- EL3 does not provide Non-secure access controls on trace register accesses through the optional memory-mapped external debug interface.

Traps to Monitor mode of System register accesses to the trace filter control registers

SDCR.TTRF traps any System register accesses to trace filter control registers to Monitor mode:

1 Any attempt to access a trace filter control register in any mode other than Monitor mode is trapped to Monitor mode.

0 This control has no effect.

Enabling Non-secure access to SIMD and floating-point functionality

NSACR.{cp11, cp10} enable Non-secure access to the SIMD and floating-point registers, from all Privilege levels:

0b11 All accesses, from both Security states, are enabled.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

0b00 Non-secure state accesses are disabled. Secure state accesses are enabled. If the PE is in Non-secure state:

- CPACR.{cp11, cp10} behave as RAZ/WI. See *Enabling PL0 and PL1 accesses to the SIMD and floating-point registers* on page G1-5327.
- HCPTR.{TCP11, TCP10} behave as RAO/WI. See *General trapping to Hyp mode of Non-secure accesses to the SIMD and floating-point registers* on page G1-5342.

Note

Software must set NSACR.cp11 and NSACR.cp10 to the same value.

For more information about SIMD and floating-point support, see *Advanced SIMD and floating-point support* on page G1-5316.

Disabling Non-secure access to Advanced SIMD functionality

NSACR.NSASEDIS disables Non-secure accesses to the Advanced SIMD functionality, from all Privilege levels:

1 Non-secure state accesses are disabled. Secure accesses are enabled. If the PE is in Non-secure state:

- CPACR.ASEDIS behaves as RAO/WI. See *Disabling PL0 and PL1 execution of Advanced SIMD instructions* on page G1-5328.
- HCPTR.TASE behaves as RAO/WI. See *Traps to Hyp mode of Non-secure accesses to Advanced SIMD functionality* on page G1-5343.

These behaviors apply even if one or both of the CPACR.ASEDIS and HCPTR.TASE controls is not implemented. See the referenced sections for more information.

0 There is no effect on CPACR.ASEDIS and HCPTR.TASE.

G1.21.5 Pseudocode description of configurable instruction enables, disables, and traps

The pseudocode function `AArch32.CheckITEnabled()` checks whether the T32 IT instruction is enabled.

The pseudocode function `AArch32.CheckSETENDEnabled()` checks whether the `SETEND` instruction is disabled.

The pseudocode function for `AArch32.CheckForSMCUndefOrTrap()` checks for traps on an `SMC` instruction.

The `AArch32.CheckForWFxTrap()` pseudocode function checks for traps on `WFE` and `WFI` instructions:

Pseudocode description of enabling SIMD and floating-point functionality

The `AArch32.CheckAdvSIMDOrFPEnabled()` and `AArch32.CheckFPAdvSIMDTrap()` pseudocode functions take appropriate action if an SIMD or floating-point instruction is used when the SIMD and floating-point functionality is not enabled or is trapped.

The `CheckAdvSIMDOrVFPEnabled()`, `CheckAdvSIMDEnabled()`, and `CheckVFPEnabled()` wrapper functions support the `AArch32.CheckAdvSIMDOrFPEnabled()` and `AArch32.CheckFPAdvSIMDTrap()` functions.

The `AArch32.CheckAdvSIMDOrFPEnabled()`, `AArch32.CheckFPAdvSIMDTrap()`, `CheckAdvSIMDOrVFPEnabled()`, `CheckAdvSIMDEnabled()`, and `CheckVFPEnabled()` functions are described in Chapter J1 *ARMv8 Pseudocode*.

Chapter G2
AArch32 Self-hosted Debug

When the PE is using self-hosted debug, it generates *debug exceptions*. This chapter describes the AArch32 self-hosted debug exception model. It is organized as follows:

Introductory information

- *About self-hosted debug* on page G2-5358.
- *The debug exception enable controls* on page G2-5362.

The debug Exception model

- *Routing debug exceptions* on page G2-5363.
- *Enabling debug exceptions from the current Privilege level and Security state* on page G2-5365.
- *The effect of powerdown on debug exceptions* on page G2-5367.
- *Summary of permitted routing and enabling of debug exceptions* on page G2-5368.
- *Pseudocode description of debug exceptions* on page G2-5370.

The debug exceptions

- *Breakpoint Instruction exceptions* on page G2-5371.
- *Breakpoint exceptions* on page G2-5374.
- *Watchpoint exceptions* on page G2-5399.
- *Vector Catch exceptions* on page G2-5413.

Synchronization requirements

The behavior of self-hosted debug after changes to System registers, or after changes to the authentication interface, but before a *Context synchronization event* guarantees the effects of the changes:

- *Synchronization and debug exceptions* on page G2-5420.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

G2.1 About self-hosted debug

Self-hosted debug supports debugging through the generation and handling of *debug exceptions*, that are taken using the exception model described in:

- Chapter D1 *The AArch64 System Level Programmers' Model*, if the exception is taken to AArch64 state.
- Chapter G1 *The AArch32 System Level Programmers' Model*, if the exception is taken to AArch32 state.

This section introduces some terms used in describing self-hosted debug, and then introduces the debug exceptions. See:

- *Definition of a debugger in the context of self-hosted debug*.
- *Context ID and Process ID*.

G2.1.1 Definition of a debugger in the context of self-hosted debug

Within this chapter, *debugger* means that part of an operating system, or higher level of system software, that handles debug exceptions and programs the debug System registers. An operating system with rich application environments might provide debug services that support a debugger user interface executing at EL0. From the architectural perspective, the debug services are the debugger.

G2.1.2 Context ID and Process ID

In AArch32 state, the CONTEXTIDR identifies the current *Context ID*, that is used by:

- The debug logic, for breakpoint and watchpoint matching.
- Implemented trace logic, to identify the current process.

When using the Long-descriptor translation table format, the CONTEXTIDR has a single field, PROCID, that is defined as the *Process Identifier* (Process ID). Therefore, in AArch64 state, the Context ID and Process ID are identical when using this translation table format.

When using the Short-descriptor translation table format:

- CONTEXTIDR[31:0] defines the Context ID, that is used for breakpoint and watchpoint matching.
- CONTEXTIDR[31:8] defines the Process ID.
- CONTEXTIDR[7:0] define the ASID. See *Global and process-specific translation table entries* on page G5-5533. This means that, when using the Short-descriptor translation table format, the ASID is always bits[7:0] of the Context ID.

G2.1.3 About debug exceptions

Debug exceptions occur during normal program flow if a debugger has programmed the PE to generate them. For example, a software developer might use a debugger contained in an operating system to debug an application. To do this, the debugger might enable one or more debug exceptions. The debug exceptions that can be generated in an AArch32 stage 1 translation regime are:

- *Breakpoint Instruction exceptions* on page G2-5359.
- *Breakpoint exceptions* on page G2-5359, generated by hardware breakpoints.
- *Watchpoint exceptions* on page G2-5360, generated by hardware watchpoints.
- *Vector Catch exceptions* on page G2-5360.

Note

In addition, *Software Step exceptions* can be generated in stage 1 of an AArch32 translation regime. However, these are always taken to AArch64 state. *Software Step exceptions* on page D2-2272 describes this.

The PE can only generate a particular debug exception when both:

1. Debug exceptions are enabled from the current Exception level and Security state.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

See *Enabling debug exceptions from the current Privilege level and Security state* on page G2-5365. Breakpoint Instruction exceptions are always enabled from the current Exception level and Security state.

2. A debugger has enabled that particular debug exception.

   All of the debug exceptions except for Breakpoint Instruction exceptions have an enable control contained in the DBGDSCRext. See *The debug exception enable controls* on page G2-5362.

Note

If *halting is allowed* and EDSCR.HDE is 1, hardware breakpoints and watchpoints cause entry to Debug state instead of causing debug exceptions. In Debug state, the PE is halted.

For the definition of halting is allowed, see *Halting allowed and halting prohibited* on page H2-6419.

When a debug exception is taken to an Exception level that is using AArch32:

- If the debug exception is a Watchpoint exception, it is taken as a Data Abort exception.
- Otherwise, it is taken as a Prefetch Abort exception.

The following list summarizes each of the debug exceptions:

Breakpoint Instruction exceptions

Breakpoint instructions generate these. Breakpoint instructions are instructions that software developers can use to cause exceptions at particular points in the program flow.

The breakpoint instruction in the A32 and T32 instruction sets is `BKPT #<immediate>`. Whenever one of these is committed for execution, the PE takes a Breakpoint Instruction exception.

PE behavior

Breakpoint Instruction exceptions cannot be masked. The PE takes Breakpoint Instruction exceptions regardless of both of the following:

- The current Privilege level and AArch32 mode.
- The current Security state.

For more information, see *Breakpoint Instruction exceptions* on page G2-5371.

Breakpoint exceptions

The ARMv8-A architecture provides 2-16 hardware breakpoints. These can be programmed to generate Breakpoint exceptions based on particular instruction addresses, or based on particular PE contexts, or both.

For example, a software developer might program a hardware breakpoint to generate a Breakpoint exception whenever the instruction with address `0x1000` is committed for execution.

The ARMv8-A architecture supports the following types of hardware breakpoint for use in stage 1 of an AArch32 translation regime:

- Address:
  - Address Match.
  - Address Mismatch.

  Comparisons are made with the virtual address of each instruction in the program flow.
- Context:
  - Context ID Match. Matches with the Context ID value held in the CONTEXTIDR.
  - VMID Match. Matches with the VMID value held in the VTTBR.
  - Context ID and VMID Match. Matches with both the Context ID and the VMID value.

An Address breakpoint can link to a Context breakpoint, so that the Address breakpoint only generates a Breakpoint exception if the PE is in a particular context when the address match or mismatch occurs.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

A breakpoint generates a Breakpoint exception whenever an instruction that causes a match is committed for execution.

PE behavior

If halting is allowed and EDSCR.HDE is 1, hardware breakpoints cause entry to Debug state. That is, they halt the PE. See Chapter H2 *Debug State*.

Otherwise:

- If debug exceptions are enabled, hardware breakpoints cause Breakpoint exceptions.
- If debug exceptions are disabled, hardware breakpoints are ignored.

For more information, see *Breakpoint exceptions* on page G2-5374.

Watchpoint exceptions

The ARMv8-A architecture provides 2-16 hardware watchpoints. These can be programmed to generate Watchpoint exceptions based on accesses to particular data addresses, or based on accesses to any address in a data address range.

For example, a software developer might program a hardware watchpoint to generate a Watchpoint exception on an access to any address in the data address range `0x1000 - 0x101F`.

A hardware watchpoint can link to a hardware breakpoint if the hardware breakpoint is a *Linked Context* type. In this case, the watchpoint only generates a Watchpoint exception if the PE is in a particular context when the data address match occurs.

The smallest data address size that a watchpoint can be programmed to match on is a byte. A single watchpoint can be programmed to match on one or more bytes.

A watchpoint generates a Watchpoint exception whenever an instruction that initiates an access that causes a match is committed for execution.

PE behavior

If halting is allowed and EDSCR.HDE is 1, hardware watchpoints cause entry to Debug state. That is, they halt the PE. See Chapter H2 *Debug State*.

Otherwise:

- If debug exceptions are enabled, hardware watchpoints cause Watchpoint exceptions.
- If debug exceptions are disabled, hardware watchpoints are ignored.

For more information, see *Watchpoint exceptions* on page G2-5399.

Vector Catch exceptions

These are used to trap exceptions. The ARMv8-A architecture provides two forms of vector catch, *address-matching* and *exception-trapping*. Only one form can be implemented.

Whichever form is implemented, a debugger must enable Vector Catch exceptions for one or more exception vectors by programming the DBGVCR. Generation of Vector Catch exceptions is then as follows:

- For the address-matching form, a Vector Catch exception is generated whenever the virtual address of an instruction matches a vector that Vector Catch exceptions are enabled for.
- For the Exception-trapping form, a Vector Catch exception is generated as part of exception entry for exception types that correspond to vectors that Vector Catch exceptions are enabled for.

PE behavior

If debug exceptions are:

- Enabled, Vector Catch exceptions can be generated.
- Disabled, vector catch is ignored.

For more information, see *Vector Catch exceptions* on page G2-5413.

Table G2-1 on page G2-5361 summarizes PE behavior and shows the location of the pseudocode for each of the debug exceptions.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Table G2-1 PE behavior and pseudocode for each of the debug exceptions

Debug exception	PE behavior if debug exceptions are:		Pseudocode
	Enabled	Disabled	
Breakpoint Instruction exception	Takes Prefetch Abort exception	Takes Prefetch Abort exception	`AArch32.SoftwareBreakpoint()`
Breakpoint exception	Takes Prefetch Abort exception[a]	Ignored	See *Pseudocode description of Breakpoint exceptions taken from AArch32 state* on page G2-5398
Watchpoint exception	Takes Data Abort exception[a]	Ignored	See *Pseudocode description of Watchpoint exceptions taken from AArch32 state* on page G2-5411
Vector Catch exception	Takes Prefetch Abort exception	Ignored	See *Pseudocode description of Vector Catch exceptions* on page G2-5419

a. If halting is allowed and EDSCR.HDE is 1, hardware breakpoints and watchpoints cause the PE to enter Debug state instead of causing debug exceptions. See Chapter H2 *Debug State*.

Non-Confidential

G2.2 The debug exception enable controls

The enable controls for each debug exception are as follows:

Breakpoint Instruction exceptions

None. Breakpoint Instruction exceptions are always enabled.

Breakpoint exceptions

DBGDSCRext.MDBGen, plus an enable control for each breakpoint, DBGBCR<n>.E.

Watchpoint exceptions

DBGDSCRext.MDBGen, plus an enable control for each watchpoint, DBGWCR<n>.E.

Vector Catch exceptions

DBGDSCRext.MDBGen.

In addition, for all debug exceptions other than Breakpoint Instruction exceptions, software must configure the controls that enable debug exceptions from the current Exception level and Security state. See *Enabling debug exceptions from the current Privilege level and Security state* on page G2-5365.

The PE cannot take a debug exception if debug exceptions are disabled from either the current Exception level or the current Security state.

Breakpoint Instruction exceptions are always enabled from the current Exception level and Security state.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

G2.3 Routing debug exceptions

Debug exceptions are usually routed to Abort mode. However, if EL2 is implemented, the routing of debug exceptions depends on the *Effective values* of HDCR.TDE and HCR.TGE:

If the *Effective value* of {HDCR.TDE, HCR.TGE} is not {0, 0}

Debug exceptions taken from Non-secure state are routed to Hyp mode.

If EL2 is using AArch64 and ARMv8.4-SecEL2 is implemented, debug exceptions taken from Secure EL0 and Secure EL1 may be routed to Secure EL2. For more information, see *Routing debug exceptions* on page D2-2275.

Otherwise

In Non-secure state debug exceptions behave as follows:

- Debug exceptions taken from Non-secure EL1 and Non-secure EL0 are routed to Non-secure Abort mode.
- Breakpoint Instruction exceptions taken from Hyp mode are routed to Hyp mode.
- All other debug exceptions are disabled from Hyp mode.

Note

If EL2 is not implemented, the *Effective value* of HCR.TGE is 0 and the *Effective value* of HDCR.TDE is 0.

Table G2-2, Table G2-3, and Table G2-4 on page G2-5364 show the routing of debug exceptions taken from an Exception level that is using AArch32 to an Exception level that is using AArch32. In these tables:

TDE Means the logical OR of HDCR.TDE and HCR.TGE.

(Hyp mode) Means:

- All debug exceptions other than Breakpoint Instruction exceptions are disabled from this Privilege level.
- Breakpoint Instruction exceptions taken from this Privilege level are taken to Hyp mode.

Table G2-2 Routing when both EL3 and EL2 are implemented

TDE	Target AArch32 mode when executing in:			
	Non-secure:			Secure state
	PL0	PL1	PL2	
0	Non-secure Abort mode	Non-secure Abort mode	(Hyp mode)	Secure Abort mode
1	Hyp mode	Hyp mode	(Hyp mode)	Secure Abort mode

Table G2-3 Routing when EL3 is implemented and EL2 is not implemented

Target AArch32 mode when executing in:	
Non-secure state	Secure state
Non-secure Abort mode	Secure Abort mode

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Table G2-4 Routing when EL3 is not implemented and EL2 is implemented

TDE	Target AArch32 mode when executing in Non-secure:		
	PL0	PL1	PL2
0	Non-secure Abort mode	Non-secure Abort mode	(Hyp mode)
1	Hyp mode	Hyp mode	(Hyp mode)

G2.3.1 Pseudocode description of routing debug exceptions

`DebugTarget()` returns the current debug target Exception level. `DebugTargetFrom()` returns the debug target Exception level for the specified Security state.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

G2.4 Enabling debug exceptions from the current Privilege level and Security state

A debug exception can only be taken if all of the following are true:

- The OS Lock is unlocked.
- `DoubleLockStatus()` == FALSE.
- The debug exception is enabled from the current Privilege level.
- The debug exception is enabled from the current Security state.

Table G2-5 shows when debug exceptions are enabled from the current Privilege level.

Table G2-5 Whether debug exceptions are enabled from the current Privilege level

Current Privilege level	Breakpoint Instruction exceptions	All other debug exceptions
PL2	Enabled	Disabled
PL1	Enabled	Enabled
PL0		

Table G2-6 shows when debug exceptions are enabled from the current Security state.

Table G2-6 Whether debug exceptions are enabled from the current Security state

Current Security state	Breakpoint Instruction exceptions	All other debug exceptions
Non-secure	Enabled	Enabled from PL1 and PL0 only.
Secure	Enabled	Depends on SDCR.SPD and SDER.SUIDEN. See *Disabling debug exceptions from Secure state*.

G2.4.1 Disabling debug exceptions from Secure state

If EL3 is implemented, software executing at EL3 can enable or disable all debug exceptions taken from Secure PL1 other than Breakpoint Instruction exceptions, by using one of:

- The *Secure Privileged Debug* field, SDCR.SPD, if EL3 is using AArch32.
- The *AArch32 Secure Privileged Debug* field, MDCR_EL3.SPD32, if EL3 is using AArch64.

If debug exceptions are disabled from Secure PL1, software executing at Secure PL1 can set the *Secure User Invasive Debug Enable* bit, SDER.SUIDEN, to 1 to enable all debug exceptions taken from Secure PL0 other than Breakpoint Instruction exceptions.

Note

Breakpoint Instruction exceptions are always enabled.

The ARMv8-A architecture does not support disabling debug in Non-secure state.

Note

If the boot software that is executed when reset is deasserted programs SUIDEN and SPD so that all debug exceptions are disabled from Secure state, software operating at EL3 never has to switch any of the debug registers between the Security states.

G2.4.2 Pseudocode description of enabling debug exceptions

`AArch64.GenerateDebugExceptions()` determines whether debug exceptions are enabled from the current Exception level and Security state. `AArch64.GenerateDebugExceptionsFrom()` determines whether debug exceptions are enabled from the specified Exception level and Security state.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

G2.5 The effect of powerdown on debug exceptions

Debug OS Save and Restore sequences on page H6-6527 describes the *powerdown save routine* and the *restore routine*.

When executing either routine, software must use the OS Lock to disable generation of all of the following:

- Breakpoint exceptions.
- Watchpoint exceptions.
- Vector Catch exceptions.

This is because the generation of these exceptions depends on the state of the debug registers, and the state of the debug registers might be lost over these routines.

Debug exceptions other than Breakpoint Instruction exceptions are enabled only if both the OS Lock is unlocked and `DoubleLockStatus()` == FALSE.

Breakpoint Instruction exceptions are enabled regardless of the state of the OS Lock and the OS Double Lock.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

G2.6 Summary of permitted routing and enabling of debug exceptions

Behavior is as follows:

Breakpoint Instruction exceptions

These are always enabled, regardless of the current Privilege level and Security state. Table G2-7 shows the routing of these. In the table, n/a means not applicable.

Table G2-7 Routing of Breakpoint Instruction exceptions

Current Security state	HDCR.TDE[a]:	Target when enabled from:		
		PL0	PL1	PL2
Secure	X	Secure Abort mode[b]	Secure Abort mode[b]	n/a
Non-secure	0	Non-secure Abort mode	Non-secure Abort mode	Hyp mode
	1	Hyp mode	Hyp mode	Hyp mode

a. If EL2 is not implemented, behavior is as if the value of this bit is 0. Otherwise, if the value of HCR.TGE is 1, HDCR.TDE is treated as being 1 other than for a direct read of HDCR.

b. If EL3 is implemented and is using AArch32, Secure Abort mode is at EL3. Otherwise, Secure Abort mode is at EL1.

All other debug exceptions

The enabling and permitted routing is controlled by all of the following:

- SDCR.SPD.
- SDER.SUIDEN.
- HDCR.TDE.
- The IMPLEMENTATION DEFINED authentication interface.

Table G2-8 shows the valid combinations of the values of SDCR.SPD, SDER.SUIDEN, HDCR.TDE, and, in the *Auth* column, the input from the IMPLEMENTATION DEFINED authentication interface described by the pseudocode function `AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled()`. For each combination, the table shows where debug exceptions are enabled from and where they are taken to.

In the table, n/a means not applicable and a dash, -, means that debug exceptions are disabled from that Exception level.

Table G2-8 Breakpoint, Watchpoint, and Vector Catch exceptions

Debug state	Lock[a]	Current Security state	SPD[b]	Auth[c]	SUIDEN	TDE[d]	Target AArch32 mode when enabled from:		
							PL0	PL1	PL2
Yes	X	X	`0bXX`	X	X	X	-	-	-
No	TRUE	X	`0bXX`	X	X	X	-	-	-
No	FALSE	Secure	`0b00`	FALSE	0	X	-	-	n/a
No	FALSE	Secure	`0b00`	FALSE	1	X	Secure Abort mode[e]	-	n/a
No	FALSE	Secure	`0b00`	TRUE	X	X	Secure Abort mode[e]	Secure Abort mode[e]	n/a
No	FALSE	Secure	`0b10`	X	0	X	-	-	n/a

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

Table G2-8 Breakpoint, Watchpoint, and Vector Catch exceptions (continued)

Debug state	Lock[a]	Current Security state	SPD[b]	Auth[c]	SUIDEN	TDE[d]	Target AArch32 mode when enabled from:		
							PL0	PL1	PL2
No	FALSE	Secure	0b10	X	1	X	Secure Abort mode[e]	-	n/a
No	FALSE	Secure	0b11	X	X	X	Secure Abort mode[e]	Secure Abort mode[e]	n/a
No	FALSE	Non-secure	0bXX	X	X	0	Non-secure Abort mode	Non-secure Abort mode	-
No	FALSE	Non-secure	0bXX	X	X	1	Hyp mode	Hyp mode	-

a. The value of (OSLSR_EL1.OSLK == 1|| DoubleLockStatus()).
b. If EL3 is not implemented, behavior is as if this is 0b11.
c. See the text that introduces this table for an explanation of the *Auth* on page G2-5368 column. An entry of TRUE indicates that the authentication mechanism permits the debug exceptions to be taken to their default target PE mode.
d. If HCR.TGE is 1, this bit is treated as being 1 other than for a direct read of HDCR. If EL2 is not implemented, behavior is as if TDE is 0.
e. If EL3 is implemented and is using AArch32, Secure Abort mode is at EL3. Otherwise, Secure Abort mode is at EL1

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

G2.7 Pseudocode description of debug exceptions

`AArch32.DebugFault()` returns a `FaultRecord()` that indicates that a memory access has generated a debug exception.

The `AArch32.Abort()` function processes `FaultRecord()`, as described in *Abort exceptions* on page G4-5462, and generates:

- Data Abort exceptions for watchpoints.
- Prefetch Abort exceptions for all other debug exceptions.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

G2.8 Breakpoint Instruction exceptions

This section describes Breakpoint Instruction exceptions in an AArch32 translation regime.

Note

When the PE is executing in EL0 using AArch32 and EL1 is using AArch64, it is using the AArch64 EL1&0 translation regime. A T32 or A32 `BKPT` instruction executed at EL0 can generate a Breakpoint Instruction exception that is taken to an Exception level that is using AArch64. For more information about the handling of these exceptions, see *Breakpoint Instruction exceptions* on page D2-2282.

It contains the following subsections:

- *About Breakpoint Instruction exceptions*.
- *Breakpoint instruction in the A32 and T32 instruction sets*.
- *BKPT instructions as the first instruction in an IT block* on page G2-5372.
- *Exception syndrome information and preferred return address for a BKPT instruction* on page G2-5372.
- *Pseudocode description of Breakpoint Instruction exceptions* on page G2-5373.

G2.8.1 About Breakpoint Instruction exceptions

A *breakpoint* is an event that results from the execution of an instruction, based on either:

- The instruction address, the PE context, or both. This type of breakpoint is called a *hardware breakpoint.*
- The instruction itself. That is, the instruction is a *breakpoint instruction*. These can be included in the program that the PE executes. This type of breakpoint is called a *software breakpoint*.

Breakpoint Instruction exceptions, that this section describes, are software breakpoints. *Breakpoint exceptions* on page G2-5374 describes hardware breakpoints.

There is no enable control for Breakpoint Instruction exceptions. They are always enabled, and cannot be masked.

A Breakpoint Instruction exception is generated whenever a breakpoint instruction is committed for execution, regardless of all of the following:

- The current Exception level.
- The current Security state.
- Whether the *debug target Exception level*, EL_D, is using AArch64 or AArch32.

Note

- EL_D is the Exception level that debug exceptions are targeting. See *Enabling debug exceptions from the current Privilege level and Security state* on page G2-5365.
- Debuggers using breakpoint instructions must be aware of the ARMv8 rules for concurrent modification and execution of instructions. See *Concurrent modification and execution of instructions* on page B2-94.

G2.8.2 Breakpoint instruction in the A32 and T32 instruction sets

The breakpoint instruction, in both instruction sets, is:

- `BKPT #<immediate>`

For details of the instruction encoding, see *BKPT* on page F5-3881.

About whether the BKPT instruction is conditional

In the T32 instruction set, `BKPT` instructions are always unconditional.

In the A32 instruction set:

- If the Condition code field is AL, the `BKPT` instruction is unconditional.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

- If the Condition code field is anything other than AL, behavior is CONSTRAINED UNPREDICTABLE, and is one of the following:
  - The instruction is UNDEFINED.
  - The instruction is treated as a NOP instruction.
  - The instruction is executed unconditionally.
  - The instruction is executed conditionally.

G2.8.3 BKPT instructions as the first instruction in an IT block

If the first instruction in an IT block is a T32 BKPT instruction, then in an implementation that supports the ITD control, if ITD field that applies to the current Exception level is:

0 The BKPT instruction generates a Breakpoint Instruction exception.

1 The combination of IT instruction and BKPT instruction is UNDEFINED. Either the IT instruction or the BKPT instruction generates an Undefined Instruction exception.

In such an implementation, to ensure consistent behavior when making the first instruction in one or more IT blocks a BKPT instruction, the debugger must replace the IT instruction.

An implementation that does not support the ITD control behaves as if the value of the ITD field is 0.

The ITD control fields are:

HSCTLR.ITD Applies to execution at EL2 when EL2 is using AArch32.

SCTLR.ITD Applies to execution at EL0 or EL1 when EL1 is using AArch32.

SCTLR_EL1.ITD
Applies to execution at EL0 using AArch32 when EL1 is using AArch64.

Note

T32 BKPT instructions are always unconditional, even when they are inside an IT block. See:

- *Disabling or enabling PL0 and PL1 use of AArch32 deprecated functionality* on page G1-5325.
- *Disabling or enabling EL2 use of AArch32 deprecated functionality* on page G1-5334.

G2.8.4 Exception syndrome information and preferred return address for a BKPT instruction

See the following:

- *Exception syndrome information for a Breakpoint Instruction exception*.
- *Preferred return address for a Breakpoint Instruction exception* on page G2-5373.

Note

Usually, the term *exception syndrome* is used only for exceptions taken to Hyp mode, or to AArch64 state. The referenced section uses the term more generally, to include exception information reported in the IFSR.

Exception syndrome information for a Breakpoint Instruction exception

The PE takes a Breakpoint Instruction exception as either:

- A Prefetch Abort exception if it is taken to PL1. In this case, it is taken to Abort mode.
- A Hyp Trap exception, if it is taken to PL2 because either HCR.TGE or HDCR.TDE is 1. In this case, it is taken to Hyp mode.

If the exception is taken to:

PL1 Abort mode

The PE sets all of the following:

- DBGDSCRext.MOE to 0b0011, to indicate a Breakpoint Instruction exception.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

- IFSR.FS to the code for a debug, 0b00010.
- The IFAR with an UNKNOWN value.

PL2 Hyp mode

The PE does all of the following:

- Records information about the exception in the *Hypervisor Syndrome Register*, HSR. See Table G2-9.
- Sets DBGDSCRext.MOE to 0b0011, to indicate a Breakpoint Instruction exception.
- Sets the HIFAR to an unknown value.

Table G2-9 Information recorded in the HSR

HSR field	Information recorded
Exception Class, EC	The PE sets this to the code for a Prefetch Abort exception routed to Hyp mode, 0x20.
Instruction Length, IL	The PE sets this to: • 0 for a T32 BKPT instruction. • 1 for an A32 BKPT instruction.
Instruction Specific Syndrome, ISS	**ISS[24:10]** RES0. **ISS[9]** *External Abort type* (EA). The PE sets this to 0. **ISS[8:6]** RES0. **ISS[5:0]** *Instruction Fault Status Code* (IFSC). The PE sets this to the code for a debug exception, 0b100010.

Note

For information about how debug exceptions can be routed to PL2, see *Routing debug exceptions on page G2-5363*.

Preferred return address for a Breakpoint Instruction exception

The preferred return address is the address of the breakpoint instruction, not the next instruction. This is different to the behavior of other exception-generating instructions, like SVC.

G2.8.5 Pseudocode description of Breakpoint Instruction exceptions

AArch32.SoftwareBreakpoint() generates a Prefetch Abort exception that is taken from AArch32 state.

G2.9 Breakpoint exceptions

This section describes Breakpoint exceptions in stage 1 of an AArch32 translation regime.

The PE is using an AArch32 translation regime when it is executing either:

- At EL1 or higher in an Exception level that is using AArch32.
- At EL0 using AArch32 when EL1 is using AArch32.

This section contains the following subsections:

- *About Breakpoint exceptions*.
- *Breakpoint types and linking of breakpoints* on page G2-5375.
- *Execution conditions for which a breakpoint generates Breakpoint exceptions* on page G2-5383.
- *Breakpoint instruction address comparisons* on page G2-5386.
- *Breakpoint context comparisons* on page G2-5391.
- *Using breakpoints* on page G2-5392.
- *Exception syndrome information and preferred return address for a Breakpoint exception* on page G2-5397.
- *Pseudocode description of Breakpoint exceptions taken from AArch32 state* on page G2-5398.

G2.9.1 About Breakpoint exceptions

A *breakpoint* is an event that results from the execution of an instruction, based on either:

- The instruction address, the PE context, or both. This type of breakpoint is called a *hardware breakpoint.*
- The instruction itself. That is, the instruction is a *breakpoint instruction*. These can be included in the program that the PE executes. This type of breakpoint is called a *software breakpoint*.

Breakpoint exceptions are generated by *Breakpoint debug events*. Breakpoint debug events are generated by hardware breakpoints. Software breakpoints are described in *Breakpoint Instruction exceptions* on page G2-5371.

An implementation can include between 2-16 hardware breakpoints. DBGDIDR.BRPs shows how many are implemented.

To use an implemented hardware breakpoint, a debugger programs the following registers for the breakpoint:

- The *Breakpoint Control Register*, DBGBCR<n>. This contains controls for the breakpoint, for example an enable control.
- The *Breakpoint Value Register*, DBGBVR<n>. This holds a value used for breakpoint matching, that is one of:
  - An instruction virtual address.
  - A Context ID.
- If EL2 is implemented, the *Breakpoint Extended Value Register*, DBGBXVR<n>, that holds a VMID value used for breakpoint matching.

These registers are numbered, so that:

- DBGBCR1, DBGBVR1, and DBGBXVR1 are for breakpoint number one.
- DBGBCR2, DBGBVR2, and DBGBXVR2 are for breakpoint number two.
- …
- …
- DBGBCR<n>, DBGBVR<n>, and DBGBXVR<n> are for breakpoint number <n>.

A debugger can link a breakpoint that is programmed with an address and a breakpoint that is programmed with anything other than an address together, so that a Breakpoint debug event is only generated if both breakpoints match.

For each instruction in the program flow, all of the breakpoints are tested. When a breakpoint is tested, it generates a Breakpoint debug event if all of the following are true:

- The breakpoint is enabled. That is, the breakpoint enable control for it, DBGBCR<n>.E, is 1.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

- The conditions specified in the DBGBCR<n> are met.
- The comparisons with the values held in one or both of the DBGBVR<n> and DBGBXVR<n>, as applicable, are successful.
- If the breakpoint is linked to another breakpoint, the comparisons made by that other breakpoint are also successful.
- The instruction is committed for execution.

If all of these conditions are met, the breakpoint generates the Breakpoint debug event regardless of the following:

- Whether the instruction passes its Condition code check.
- The instruction type.

If halting is allowed and EDSCR.HDE is 1, Breakpoint debug events cause entry to Debug state.

Otherwise, if debug exceptions are

- Enabled, Breakpoint debug events generate Breakpoint exceptions
- Disabled, Breakpoint debug events are ignored.

Note

The remainder of this Breakpoint exceptions section, including all subsections, describes breakpoints as generating Breakpoint exceptions. However, the behavior described also applies if breakpoints are causing entry to Debug state.

The debug exception enable controls on page G2-5362 describes the enable controls for Breakpoint debug events.

G2.9.2 Breakpoint types and linking of breakpoints

Each implemented breakpoint is one of the following:

- A *context-aware* breakpoint. This is a breakpoint that can be programmed to generate a Breakpoint exception on any one of the following:
  - An instruction address match.
  - An instruction address mismatch.
  - A Context ID match, with the value held in the CONTEXTIDR.
  - A VMID match, with the value held in the VTTBR.
  - Both a Context ID match and a VMID match.
- A breakpoint that is not context-aware. These can only be programmed to generate a Breakpoint exception on an instruction address match or an instruction address mismatch.

DBGDIDR.CTX_CMPs shows how many of the implemented breakpoints are context-aware breakpoints. At least one implemented breakpoint must be context-aware. The context-aware breakpoints are the highest numbered breakpoints.

Any breakpoint that is programmed to generate a Breakpoint exception on an instruction address match or mismatch is categorized as an *Address breakpoint*. Breakpoints that are programmed to match on anything else are categorized as *Context breakpoints*.

When a debugger programs a breakpoint to be an Address or a Context breakpoint, it must also program that breakpoint so that it is either:

- Used in isolation. In this case, the breakpoint is called an *Unlinked breakpoint*.
- Enabled for linking to another breakpoint. In this case, the breakpoint is called a *Linked breakpoint*.

By linking an Address breakpoint and a Context breakpoint together, the debugger can create a breakpoint pair that only generates a Breakpoint exception if the PE is in a particular context when an instruction address match or mismatch occurs. For example, a debugger might:

1. Program breakpoint number one to be a *Linked Address Match breakpoint*.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

2. Program breakpoint number five to be a *Linked Context ID Match breakpoint*.

3. Link these two breakpoints together. A Breakpoint exception is only generated if both the instruction address matches and the Context ID matches.

The *Breakpoint Type* field for a breakpoint, DBGBCR<n>.BT, controls the breakpoint type and whether the breakpoint is enabled for linking. If BT[0] is 1, the breakpoint is enabled for linking.

Address breakpoints can be programmed to generate Breakpoint exceptions on addresses that are halfword-aligned but not word-aligned. This makes it possible to breakpoint on T32 instructions. See *Specifying the halfword-aligned address that an Address breakpoint matches on* on page G2-5386.

Rules for linking breakpoints

The rules for breakpoint linking are as follows:

- Only Linked breakpoint types can be linked.
- Any type of Linked Address breakpoint can link to any type of Linked Context breakpoint. The *Linked Breakpoint Number* field, DBGBCR<n>.LBN, for the Linked Address breakpoint specifies the particular Linked Context breakpoint that the Linked Address breakpoint links to, and:
  - DBGBCR<n>.{SSC, HMC, PMC} for the Linked Address breakpoint define the execution conditions that the breakpoint pair generates Breakpoint exceptions for. See *Execution conditions for which a breakpoint generates Breakpoint exceptions* on page G2-5383.
  - DBGBCR<n>.{SSC, HMC, PMC} for the Linked Context breakpoint are ignored.
- Linked Context breakpoint types can only be linked to. The LBN field for Context breakpoints is therefore ignored.
- Linked Address breakpoints cannot link to watchpoints. The LBN field can therefore only specify another breakpoint.
- If a Linked Address breakpoint links to a breakpoint that is not context-aware, the behavior of the Linked Address breakpoint is CONSTRAINED UNPREDICTABLE. See *Other usage constraints for Address breakpoints* on page G2-5396.
- If a Linked Address breakpoint links to an Unlinked Context breakpoint, the Linked Address breakpoint never generates any Breakpoint exceptions.
- Multiple Linked Address breakpoints can link to a single Linked Context breakpoint.

  Note

  Multiple Linked watchpoints can also link to a single Linked Context breakpoint. *Watchpoint exceptions* on page G2-5399 describes watchpoints.

These rules mean that a single Linked Context breakpoint might be linked to by all, or any combination of, the following:

- Multiple Linked Address Match breakpoints.
- Multiple Linked Address Mismatch breakpoints.
- Multiple Linked watchpoints.

It is also possible that a Linked Context breakpoint might have no breakpoints or watchpoints linked to it.

Figure G2-1 on page G2-5377 shows an example of permitted breakpoint and watchpoint linking.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

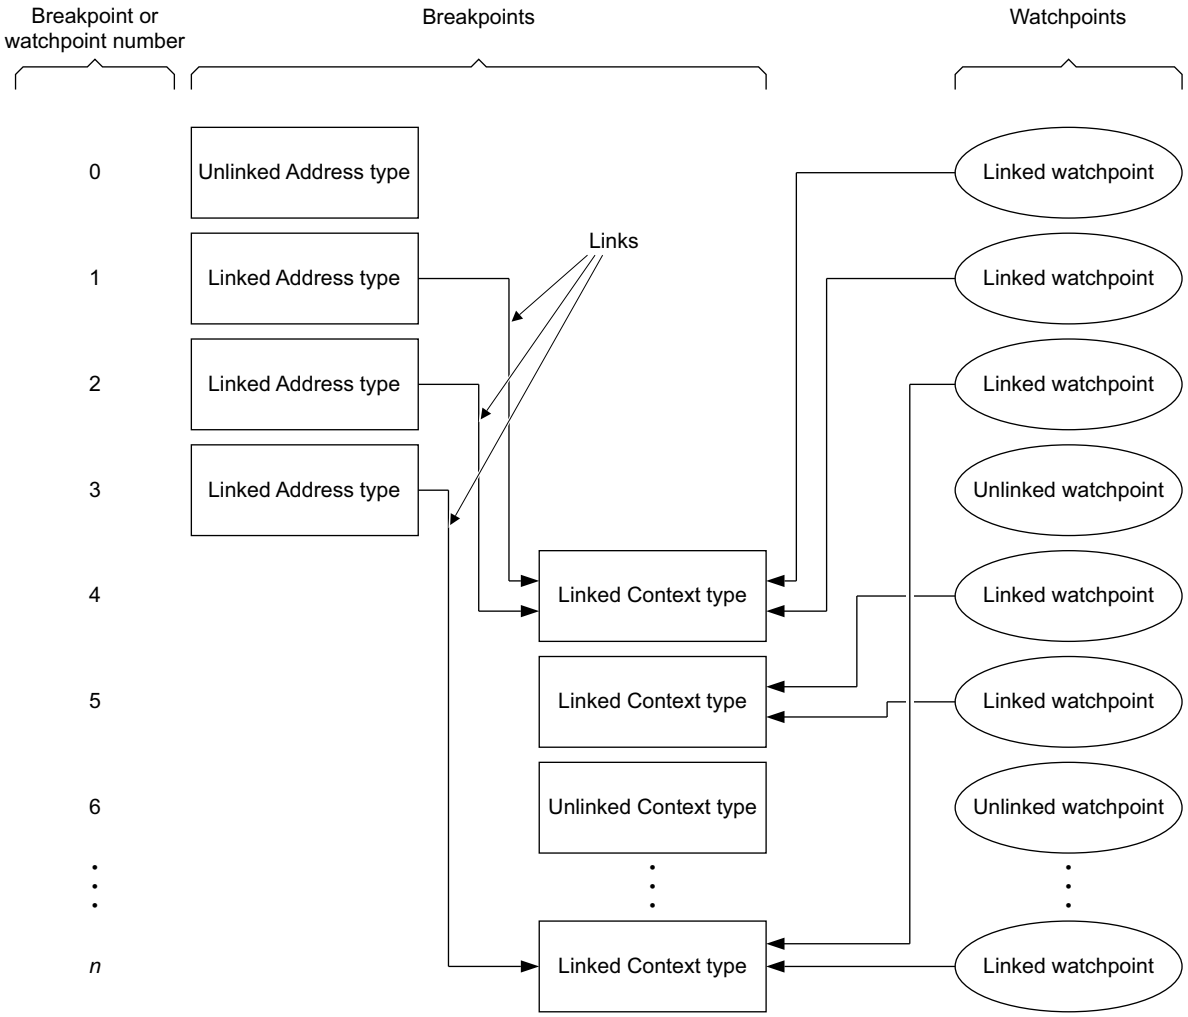

Figure G2-1 The role of linking in Breakpoint and Watchpoint exception generation

In Figure G2-1, each Linked Address breakpoint can only generate a Breakpoint exception if the comparisons made by both it, and the Linked Context breakpoint that it links to, are successful. Similarly, each Linked watchpoint can only generate a Watchpoint exception if the comparisons made by both it, and the Linked Context breakpoint that it links to, are successful.

Breakpoint types defined by DBGBCRn.BT

The following list provides more detail about each breakpoint type:

`0b0000`, Unlinked Address Match breakpoint

Generation of a Breakpoint exception depends on both:

- DBGBCR<n>.{SSC, HMC, PMC}. These define the execution conditions that the breakpoint generates Breakpoint exceptions for. See *Execution conditions for which a breakpoint generates Breakpoint exceptions* on page G2-5383.
- A successful address match, as described in *Breakpoint instruction address comparisons* on page G2-5386.

DBGBCR<n>.LBN for this breakpoint is ignored.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

0b0001, Linked Address Match breakpoint

Generation of a Breakpoint exception depends on all of the following:

- DBGBCR<n>.{SSC, HMC, PMC} for this breakpoint. These define the execution conditions that the breakpoint generates Breakpoint exceptions for. See *Execution conditions for which a breakpoint generates Breakpoint exceptions* on page G2-5383.
- A successful address match defined by this breakpoint, as described in *Breakpoint instruction address comparisons* on page G2-5386.
- A successful context match defined by the Linked Context breakpoint that this breakpoint links to.

DBGBCR<n>.LBN for this breakpoint selects the Linked Context breakpoint that this breakpoint links to.

0b0010, Unlinked Context ID Match breakpoint

BT == 0b0010 is a reserved value if the breakpoint is not a context-aware breakpoint.

For context-aware breakpoints, generation of a Breakpoint exception depends on both:

- DBGBCR<n>.{SSC, HMC, PMC}. These define the execution conditions that the breakpoint generates Breakpoint exceptions for. See *Execution conditions for which a breakpoint generates Breakpoint exceptions* on page G2-5383.
- A successful Context ID match, as described in *Breakpoint context comparisons* on page G2-5391.

The value of DBGBVR<n>.ContextID is compared with the current Context ID.

CONTEXTIDR_EL2 holds the current Context ID when all of:

- The implementation includes ARMv8.1-VHE.
- EL2 is implemented and enabled in the current Security state.
- EL2 using AArch64 and the value of HCR_EL2.E2H is 1.
- The PE is executing at EL0 and HCR_EL2.TGE is 1, or the PE is executing at EL2.

Otherwise, CONTEXTIDR holds the current Context ID.

DBGBCR<n>.{LBN, BAS} for this breakpoint are ignored

0b0011, Linked Context ID Match breakpoint

BT == 0b0011 is a reserved value if the breakpoint is not a context-aware breakpoint.

For context-aware breakpoints, either:

- This breakpoint does not generate any Breakpoint exceptions, if no Linked breakpoints or Linked watchpoints link to it.
- Generation of a Breakpoint exception depends on both:
  - A successful instruction address match, defined by a Linked Address breakpoint that links to this breakpoint, see *Breakpoint instruction address comparisons* on page G2-5386.
  - A successful Context ID match defined by this breakpoint, as described in *Breakpoint context comparisons* on page G2-5391.
- Generation of a Watchpoint exception depends on both:
  - A successful data address match, defined by a Linked watchpoint that links to this breakpoint, see *Watchpoint data address comparisons* on page G2-5403.
  - A successful Context ID match defined by this breakpoint, as described in *Breakpoint context comparisons* on page G2-5391.

The value of DBGBVR<n>.ContextID is compared with the current Context ID.

CONTEXTIDR_EL2 holds the current Context ID when all of:

- The implementation includes ARMv8.1-VHE.
- EL2 is implemented and enabled in the current Security state.
- EL2 using AArch64 and the value of HCR_EL2.E2H is 1.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

- The PE is executing at EL0 and HCR_EL2.TGE is 1, or the PE is executing at EL2.

Otherwise, CONTEXTIDR holds the current Context ID.

DBGBCR<n>.{LBN, SSC, HMC, BAS PMC} for this breakpoint are ignored.

0b0100, Unlinked Address Mismatch breakpoint

Generation of a Breakpoint exception depends on both:

- DBGBCR<n>.{SSC, HMC, PMC}. These define the execution conditions that the breakpoint generates Breakpoint exceptions for. See *Execution conditions for which a breakpoint generates Breakpoint exceptions* on page G2-5383.
- A successful address mismatch, as described in *Breakpoint instruction address comparisons* on page G2-5386.

DBGBCR<n>.LBN for this breakpoint is ignored.

0b0101, Linked Address Mismatch breakpoint

Generation of a Breakpoint exception depends on all of the following:

- DBGBCR<n>.{SSC, HMC, PMC}. These define the execution conditions that the breakpoint generates Breakpoint exceptions for. See *Execution conditions for which a breakpoint generates Breakpoint exceptions* on page G2-5383.
- A successful address mismatch defined by this breakpoint, as described in *Breakpoint instruction address comparisons* on page G2-5386.
- A successful context match defined by the Linked Context breakpoint that this breakpoint links to.

DBGBCR<n>.LBN for this breakpoint selects the Linked Context breakpoint that this breakpoint links to.

0b0110, Unlinked CONTEXTIDR_EL1 Match breakpoint

BT == 0b0110 is a reserved value if either:

- The breakpoint is not a context-aware breakpoint.
- The implementation does not include ARMv8.1-VHE.

For context-aware breakpoints, generation of a Breakpoint exception depends on both:

- DBGBCR<n>.{SSC, HMC, PMC}. These define the execution conditions for which the breakpoint generates Breakpoint exceptions.
- A successful Context ID match defined by this breakpoint, as described in *Breakpoint context comparisons* on page G2-5391.

The Context ID check is made against the value in CONTEXTIDR, or CONTEXTIDR_EL1. The value of DBGBVR<n>.ContextID is compared with the Context ID value held in CONTEXTIDR or CONTEXTIDR_EL1.

DBGBCR<n>.{LBN, BAS} for this breakpoint are ignored.

0b0111, Linked CONTEXTIDR_EL1 Match breakpoint

BT == 0b0111 is a reserved value if either:

- The breakpoint is not a context-aware breakpoint.
- The implementation does not include ARMv8.1-VHE.

For context-aware breakpoints, one of the following applies:

- If no Linked breakpoints or Linked watchpoints link to this breakpoint, then the breakpoint does not generate any Breakpoint exceptions.
- Generation of a Breakpoint exception depends on both:
  - A successful instruction address match, defined by a Linked Address match breakpoint that links to this breakpoint, see *Breakpoint instruction address comparisons* on page G2-5386.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

- A successful Context ID match defined by this breakpoint, as described in *Breakpoint context comparisons* on page G2-5391.

- Generation of a Watchpoint exception depends on both:
  - A successful data address match, defined by a Linked watchpoint that links to this breakpoint, see *Watchpoint data address comparisons* on page G2-5403.
  - A successful Context ID match defined by this breakpoint, as described in *Breakpoint context comparisons* on page G2-5391.

The Context ID check is made against the value in CONTEXTIDR, or CONTEXTIDR_EL1. The value of DBGBVR<n>.ContextID is compared with the Context ID value held in CONTEXTIDR or CONTEXTIDR_EL1.

DBGBCR<n>.{LBN, SSC, HMC, BAS, PMC} for this breakpoint are ignored.

`0b1000`, Unlinked VMID Match breakpoint

BT == `0b1000` is a reserved value if either:

- The breakpoint is not a context-aware breakpoint.
- EL2 is not implemented.

For context-aware breakpoints, generation of a Breakpoint exception depends on both:

- DBGBCR<n>.{SSC, HMC, PMC}. These define the execution conditions that the breakpoint generates Breakpoint exceptions for. See *Execution conditions for which a breakpoint generates Breakpoint exceptions* on page G2-5383.
- A successful VMID match, as described in *Breakpoint context comparisons* on page G2-5391.

DBGBCR<n>.{LBN, BAS} for this breakpoint are ignored.

`0b1001`, Linked VMID Match breakpoint

BT == `0b1000` is a reserved value if either:

- The breakpoint is not a context-matching breakpoint.
- EL2 is not implemented.

For context-aware breakpoints, either:

- This breakpoint does not generate any Breakpoint exceptions, if no Linked breakpoints or Linked watchpoints link to it.
- Generation of a Breakpoint exception depends on both:
  - A successful instruction address match, defined by a Linked Address Match breakpoint that links to this breakpoint. See *Breakpoint instruction address comparisons* on page G2-5386.
  - A successful VMID match defined by this breakpoint.
- Generation of a Watchpoint exception depends on both:
  - A successful data address match, defined by a Linked watchpoint that links to this breakpoint, see *Watchpoint data address comparisons* on page G2-5403.
  - A successful VMID match defined by this breakpoint, as described in *Breakpoint context comparisons* on page G2-5391.

DBGBCR<n>.{LBN, SSC, HMC, BAS, PMC} for this breakpoint are ignored.

`0b1010`, Unlinked Context ID and VMID Match breakpoint

BT == `0b1010` is a reserved value if either:

- The breakpoint is not a context-matching breakpoint.
- EL2 is not implemented.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

For context-matching breakpoints, generation of a Breakpoint exception depends on all of the following:

- DBGBCR<n>.{SSC, HMC, PMC}. These define the execution conditions that the breakpoint generates Breakpoint exceptions for. See *Execution conditions for which a breakpoint generates Breakpoint exceptions* on page G2-5383.
- A successful Context ID match, as described in *Breakpoint context comparisons* on page G2-5391.
- A successful VMID match.

The value of DBGBVR<n>.ContextID is compared with CONTEXTIDR.

Breakpoint context comparisons on page G2-5391 describes the requirements for a successful Context ID match and a successful VMID match.

DBGBCR<n>.{LBN, BAS} for this breakpoint are ignored.

`0b1011`, Linked Context ID and VMID Match breakpoint

BT == `0b1011` is a reserved value if either:

- The breakpoint is not a context-matching breakpoint.
- EL2 is not implemented.

For context-matching breakpoints, either:

- This breakpoint does not generate any Breakpoint exceptions, if no Linked breakpoints or Linked watchpoints link to it.
- Generation of a Breakpoint exception depends on all of the following:
  - A successful instruction address match, defined by a Linked Address breakpoint that links to this breakpoint, see *Breakpoint instruction address comparisons* on page G2-5386.
  - A successful Context ID match defined by this breakpoint, as described in *Breakpoint context comparisons* on page G2-5391.
  - A successful VMID match defined by this breakpoint.
- Generation of a Watchpoint exception depends on all of the following:
  - A successful data address match, defined by a Linked watchpoint that links to this breakpoint, see *Watchpoint data address comparisons* on page G2-5403.
  - A successful Context ID match defined by this breakpoint, as described in *Breakpoint context comparisons* on page G2-5391.
  - A successful VMID match defined by this breakpoint.

The value of DBGBVR<n>.ContextID is compared with CONTEXTIDR.

Breakpoint context comparisons on page G2-5391 describes the requirements for a successful Context ID match and a successful VMID match by this breakpoint.

DBGBCR<n>.{LBN, SSC, HMC, BAS, PMC} for this breakpoint are ignored.

`0b1100`, Unlinked CONTEXTIDR_EL2 Match breakpoint

BT == `0b1100` is a reserved value if:

- The breakpoint is not a context-aware breakpoint.
- The implementation does not include ARMv8.1-VHE.
- EL2 is not implemented.

For context-aware breakpoints, generation of a Breakpoint exception depends on both:

- DBGBCR<n>.{SSC, HMC, PMC}. These define the execution conditions for which the breakpoint generates Breakpoint exceptions.
- A successful CONTEXTIDR_EL2 match.The value of DBGBVR<n>.ContextID2 is compared with the Context ID value held in CONTEXTIDR_EL2, as described in *Breakpoint context comparisons* on page G2-5391.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

The check against CONTEXTIDR_EL2 means this breakpoint can be generated only if EL2 is implemented and enabled in the current Security state and EL2 is using AArch64.

Note

The operation of this breakpoint does not depend on the value of HCR_EL2.E2H.

DBGBCR<n>.{LBN, BAS} for this breakpoint are ignored.

`0b1101`, Linked CONTEXTIDR_EL2 Match

BT == `0b1101` is a reserved value if:

- The breakpoint is not a context-aware breakpoint.
- The implementation does not include ARMv8.1-VHE.
- EL2 is not implemented.

For context-aware breakpoints, either:

- If no Linked breakpoints or Linked watchpoints link to this breakpoint, then the breakpoint does not generate any Breakpoint exceptions.
- Generation of a Breakpoint exception depends on both:
  - A successful instruction address match, defined by a Linked Address match breakpoint that links to this breakpoint, see *Breakpoint instruction address comparisons* on page G2-5386.
  - A successful CONTEXTIDR_EL2 match, as described in *Breakpoint context comparisons* on page G2-5391.
- Generation of a Watchpoint exception depends on both:
  - A successful data address match, defined by a Linked watchpoint that links to this breakpoint, see *Watchpoint data address comparisons* on page G2-5403.
  - A successful CONTEXTIDR_EL2 match. The value of DBGBVR<n>.ContextID2 is compared with the Context ID value held in CONTEXTIDR_EL2, as described in *Breakpoint context comparisons* on page G2-5391.

The check against the CONTEXTIDR_EL2 means the breakpoint or watchpoint can be generated only if EL2 is implemented and enabled in the current Security state and EL2 is using AArch64.

Note

The operation of this breakpoint does not depend on the value of HCR_EL2.E2H.

DBGBCR<n>.{LBN, SSC, HMC, BAS, PMC} for this breakpoint are ignored.

`0b1110`, Unlinked Full Context ID Match breakpoint

BT == `0b1110` is a reserved value if:

- The breakpoint is not a context-aware breakpoint.
- The implementation does not include ARMv8.1-VHE.
- EL2 is not implemented.

For context-aware breakpoints, generation of a Breakpoint exception depends on both:

- DBGBCR<n>.{SSC, HMC, PMC}. These define the execution conditions for which the breakpoint generates Breakpoint exceptions.
- A successful Context ID match, as described in *Breakpoint context comparisons* on page G2-5391.

The Context ID check is made by checking both:

- The value of DBGBVR<n>.ContextID against the value in CONTEXTIDR, or CONTEXTIDR_EL1.
- The value of DBGBXVR<n>.ContextID2 against the value in CONTEXTIDR_EL2.

Both comparisons must match for the check to succeed.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

The check against the CONTEXTIDR_EL2 means this breakpoint can be generated only if EL2 is implemented and enabled in the current Security state and EL2 is using AArch64.

Note

The operation of this breakpoint does not depend on the value of HCR_EL2.E2H.

DBGBCR<n>.{LBN, BAS} for this breakpoint are ignored.

`0b1111`, Linked Full Context ID Match breakpoint

BT == `0b1111` is a reserved value if:

- The breakpoint is not a context-aware breakpoint.
- The implementation does not include ARMv8.1-VHE.
- EL2 is not implemented.

For context-aware breakpoints, one of the following applies:

- If no Linked breakpoints or Linked watchpoints link to this breakpoint, then the breakpoint does not generate any Breakpoint exceptions.
- Generation of a Breakpoint exception depends on both:
  - A successful instruction address match, defined by a Linked Address match breakpoint that links to this breakpoint, see *Breakpoint instruction address comparisons* on page G2-5386.
  - A successful Context ID match, as described in *Breakpoint context comparisons* on page G2-5391.
- Generation of a Watchpoint exception depends on both:
  - A successful data address match, defined by a Linked watchpoint that links to this breakpoint, see *Watchpoint data address comparisons* on page G2-5403.
  - A successful Context ID match, as described in *Breakpoint context comparisons* on page G2-5391.

The Context ID check is made by checking both:

- The value of DBGBVR<n>.ContextID against the value in CONTEXTIDR, or CONTEXTIDR_EL1.
- The value of DBGBXVR<n>.ContextID2 against the value in CONTEXTIDR_EL2.

Both comparisons must match for the check to succeed.

The check against the CONTEXTIDR_EL2 means the breakpoint or watchpoint can be generated only if EL2 is implemented and enabled in the current Security state and EL2 is using AArch64.

Note

The operation of this breakpoint does not depend on the value of HCR_EL2.E2H.

DBGBCR<n>.{LBN, SSC, HMC, BAS, PMC} for this breakpoint are ignored.

Note

See *Reserved DBGBCR<n>.BT values* on page G2-5394 for the behavior of breakpoints programmed with reserved BT values.

G2.9.3 Execution conditions for which a breakpoint generates Breakpoint exceptions

Each breakpoint can be programmed so that it only generates Breakpoint exceptions for certain execution conditions. For example, a breakpoint might be programmed to generate Breakpoint exceptions only when the PE is executing at PL0 in Secure state.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

DBGBCR<n>.{SSC, HMC, PMC} define the execution conditions the breakpoint generates Breakpoint exceptions for, as follows:

Security State Control, SSC

Controls whether the breakpoint generates Breakpoint exceptions only in Secure state, only in Non-secure state, or in both Security states.

Note

This is determined by the Security state of the PE, not from the NS attribute returned by the translation of the virtual address on which the breakpoint is set.

Higher Mode Control, HMC, and Privileged Mode Control, PMC

HMC and PMC together control which AArch32 modes the breakpoint generates Breakpoint exceptions in.

Table G2-10 shows the valid combinations of the values of HMC, SSC, and PMC, and for each combination shows which Privilege levels breakpoints generate Breakpoint exceptions in.

In the table:

Y Means that a breakpoint programmed with the values of HMC, SSC and PMC shown in that row can generate Breakpoint exceptions in AArch32 modes at that Privilege level.

- Means that a breakpoint programmed with the values of HMC, SSC and PMC shown in that row cannot generate Breakpoint exceptions in AArch32 modes at that Privilege level.

Res Means that the combination of HMC, SSC, and PMC is reserved. See *Reserved DBGBCR<n>.{SSC, HMC, PMC} values* on page G2-5395.

Table G2-10 Summary of breakpoint HMC, SSC, and PMC encodings

HMC	SSC	PMC	Security state the breakpoint is programmed to match in	PL2[a]	PL1	PL0
0	00	00	Both	-	Y[b]	Y
0	00	01		-	Y	-
0	00	10		-	-	Y
0	00	11		-	Y	Y
0	01	00	Non-Secure	-	Y[b]	Y
0	01	01		-	Y	-
0	01	10		-	-	Y
0	01	11		-	Y	Y
0	10	00	Secure	-	Y[b]	Y
0	10	01		-	Y	-
0	10	10		-	-	Y
0	10	11		-	Y	Y
0	11	01	Secure	Y	Y	-
0	11	11		Y	Y	Y

Table G2-10 Summary of breakpoint HMC, SSC, and PMC encodings (continued)

HMC	SSC	PMC	Security state the breakpoint is programmed to match in	PL2[a]	PL1	PL0
1	00	01	Both	Y	Y	-
1	00	11		Y	Y	Y
1	01	00	Non-secure	Y		-
1	01	01		Y	Y	-
1	01	11		Y	Y	Y
1	10	01	Secure	Y	Y	-
1	10	11		Y	Y	Y
1	11	00	Both	Y	-	-
1	11	01		Y	Y	-
1	11	11		Y	Y	Y

a. Debug exceptions are not generated at PL2 using AArch32. This means that these combinations of HMC, SSC, and PMC are only relevant if breakpoints cause entry to Debug state. Self-hosted debuggers must avoid combinations of HMC, SSC, and PMC that generate Breakpoint exceptions at PL2 using AArch32.

b. Only in User, System and Supervisor modes.

All combinations of HMC, SSC, and PMC that this table does not show are reserved. See *Reserved HMC, SSC, and PMC combinations* on page G2-5395.

G2.9.4 Breakpoint instruction address comparisons

Address comparisons are made for each instruction in the program flow. The following subsections describe the criteria for a successful address comparison, for:

- *Address Match breakpoints*.
- *Address Mismatch breakpoints*.

Address Match breakpoints

An address match comparison is successful if both:

- Bits [31:2] of the current instruction virtual address are equal to DBGBVR<n>[31:2].
- The word or halfword selected by DBGBCR<n>.BAS matches. That is, either:
  - DBGBCR<n>.BAS is programmed with `0b0011` or `0b1111`, and the instruction is at a word-aligned address.
  - DBGBCR<n>.BAS is programmed with `0b1100`, and the instruction is not at a word-aligned address.

  See *Specifying the halfword-aligned address that an Address breakpoint matches on*.

Note

DBGBVR<n>[1:0] are RES0 and are ignored.

Address Mismatch breakpoints

An address mismatch comparison is successful if either:

- Bits [31:2] of the current instruction virtual address are not equal to DBGBVR<n>[31:2].
- The word or halfword selected by DBGBCR<n>.BAS does not match. That is, either:
  - DBGBCR<n>.BAS is programmed with `0b0011` or `0b1111`, and the instruction is not at a word-aligned address.
  - DBGBCR<n>.BAS is programmed with `0b1100`, and the instruction is at a word-aligned address.

  See *Specifying the halfword-aligned address that an Address breakpoint matches on*.

Note

- DBGBVR<n>[1:0] are RES0 and are ignored.
- Address Mismatch breakpoints can be used to single-step through code. See *Using an Address Mismatch breakpoint to single-step an instruction* on page G2-5392.

Specifying the halfword-aligned address that an Address breakpoint matches on

For an Address breakpoint, a debugger can use the *Byte Address Selection* field, DBGBCR<n>.BAS, so that the address comparison is successful on one of:

- The whole word starting at address DBGBVR<n>[31:2]:00.
- The halfword starting at address DBGBVR<n>[31:2]:00.
- The halfword starting at address ((DBGBVR<n>[31:2]:00) + 2).

Note

The address programmed into the DBGBVR<n> must be word-aligned.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

DBGBCR<n>.BAS can be used in both Address Match breakpoints and Address Mismatch breakpoints, as follows:

- For an Address Match breakpoint, DBGBCR<n>.BAS selects which halfword-aligned address the breakpoint must generate a Breakpoint exception for. This means that an address comparison is successful only if both of the following match:
  - The instruction address held in bits [31:2] of the DBGBVR<n>.
  - The halfword defined by the BAS field.

  That is, a successful address comparison = DBGBVR<n>[31:2] match AND BAS match.
- For an Address Mismatch breakpoint, DBGBCR<n>.BAS selects which halfword-aligned address the breakpoint must not generate a Breakpoint exception for. This means that an address comparison is successful if either or both of the following do not match:
  - The instruction address held in bits [31:2] of the DBGBVR<n>.
  - The halfword defined by the BAS field.

  That is, a successful address comparison = NOT (DBGBVR<n>[31:2] match AND BAS match).

The following subsections show the supported BAS values:

- *Using the BAS field in Address Match breakpoints*.
- *Using the BAS field in Address Mismatch breakpoints* on page G2-5389.

For Context breakpoints, DBGBCR<n>.BAS is RES1 and is ignored.

Using the BAS field in Address Match breakpoints

The supported BAS values are:

`0b0000` This value is reserved. Behavior is a CONSTRAINED UNPREDICTABLE choice of:
- The breakpoint is disabled.
- The breakpoint behaves as if BAS is `0b0011`, `0b1100`, or `0b1111`.

`0b0011` The breakpoint generates a Breakpoint exception if an instruction with an address described as follows is committed for execution:
- Bits [31:2] of the address equals DBGBVR<n>[31:2].
- Bits [1:0] of the address are `0b00`.

This means that breakpoints programmed with this BAS value generate Breakpoint exceptions for all of the following:
- 32-bit T32 instructions at word-aligned addresses.
- 16-bit T32 instructions at word-aligned addresses.
- A32 instructions. These are always at word-aligned addresses.

However, ARM recommends that a debugger uses this BAS value only for T32 instructions.

It is CONSTRAINED UNPREDICTABLE whether a breakpoint programmed with this BAS value generates a Breakpoint exception on the second halfword of a 32-bit T32 instruction starting at the halfword-aligned address ((DBGBVR<n>[31:2]:00) - 2).

`0b1100` The breakpoint generates a Breakpoint exception if an instruction with an address described as follows is committed for execution:
- Bits [31:2] of the address equals DBGBVR<n>[31:2].
- Bits [1:0] of the address are `0b10`.

This means that breakpoints programmed with this BAS value generate Breakpoint exceptions for both of the following:
- 32-bit T32 instructions at addresses that are halfword-aligned but not word-aligned.
- 16-bit T32 instructions at addresses that are halfword-aligned but not word-aligned.

It is CONSTRAINED UNPREDICTABLE whether a breakpoint programmed with this BAS value generates a Breakpoint exception on the second halfword of a 32-bit T32 or A32 instruction starting at a word-aligned address.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

`0b1111` The breakpoint generates a Breakpoint exception if an instruction with an address described as follows is committed for execution:

- Bits [31:2] of the address equals DBGBVR<n>[31:2].
- Bits [1:0] of the address are `0b00`.

This means that breakpoints programmed with this BAS value generate Breakpoint exceptions for all of the following:

- 32-bit T32 instructions at word-aligned addresses.
- 16-bit T32 instructions at word-aligned addresses.
- A32 instructions. These are always at word-aligned addresses.

However, ARM recommends that a debugger uses this BAS value only for A32 instructions.

It is CONSTRAINED UNPREDICTABLE whether a breakpoint programmed with this BAS value generates a Breakpoint exception on the second halfword of a 32-bit T32 instruction starting at the halfword-aligned address ((DBGBVR<n>[31:2]:00) - 2).

It is CONSTRAINED UNPREDICTABLE whether a breakpoint programmed with this BAS value generates a Breakpoint exception on a 32-bit T32 instruction or a 16-bit T32 instruction at the halfword-aligned address ((DBGBVR<n>[31:2]:00) + 2).

All other BAS values are reserved. For these reserved other values, DBGBCR<n>.BAS[3,1] ignore writes and read the same values as DBGBCR<n>[2,0] respectively. This means that the smallest instruction size a debugger can program breakpoints to match on is a halfword.

Figure G2-2 on page G2-5389 shows a summary of when breakpoints programmed with particular BAS values generate Breakpoint exceptions.

The figure contains four parts:

- A column showing the row number, on the left.
- An instruction set and instruction size table.
- A location of instruction figure.
- A BAS field values table, on the right.

To use the figure, read across the rows. For example:

- Row 2 shows that a breakpoint with a BAS value of `0b1100` generates Breakpoint exceptions for 16-bit T32 instructions starting at the halfword-aligned address ((DBGBVR<n>[31:2]:00) + 2).
- Row 6 shows that a breakpoint with a BAS value of either `0b0011` or `0b1111` generates Breakpoint exceptions for A32 instructions. A32 instructions are always at word-aligned addresses.

In the figure:

Yes Means that the breakpoint generates a Breakpoint exception.

No Means that the breakpoint does not generate a Breakpoint exception.

UNP Means that it is CONSTRAINED UNPREDICTABLE whether the breakpoint generates a Breakpoint exception. See *Other usage constraints for Address breakpoints* on page G2-5396.

Row 4		32-bit			■	■	■	■			Yes	UNP	Yes
Row 5		32-bit					■	■	■	■	No	Yes	UNP
Row 6	A32	32-bit			■	■	■	■			Yes	UNP	Yes

a. 0 means the word-aligned address held in the DBGBVRn. The other locations are as follows:
- -2 means ((DBGBVRn[31:2]:00) - 2).
- -1 means ((DBGBVRn[31:2]:00) - 1).
- ...
- ...
- +5 means ((DBGBVRn[31:2]:00) + 5).

The solid areas show the location of the instruction.

Figure G2-2 Summary of BAS field meanings for Address Match breakpoints

Using the BAS field in Address Mismatch breakpoints

An Address Mismatch breakpoint generates Breakpoint exceptions for all instructions committed for execution, except the instruction whose address the breakpoint is programmed to match.

The supported BAS values are:

`0b0000` The breakpoint ignores the address held in the DBGBVR<n> and generates Breakpoint exceptions for all instruction addresses.

`0b0011` The breakpoint does not generate a Breakpoint exception if an instruction with an address described as follows is committed for execution:
- Bits [31:2] of the address equals DBGBVR<n>[31:2].
- Bits [1:0] of the address are `0b00`.

This means that breakpoints programmed with this BAS value do not generate Breakpoint exceptions for any of the following:
- 32-bit T32 instructions at word-aligned addresses.
- 16-bit T32 instructions at word-aligned addresses.
- A32 instructions. These are always at word-aligned addresses.

However, ARM recommends that a debugger uses this BAS value only for T32 instructions.

It is CONSTRAINED UNPREDICTABLE whether a breakpoint programmed with this BAS value does not generate a Breakpoint exception on the second halfword of a 32-bit T32 instruction starting at the halfword-aligned address ((DBGBVR<n>[31:2]:00) - 2).

`0b1100` The breakpoint does not generate a Breakpoint exception if an instruction with an address described as follows is committed for execution:
- Bits [31:2] equals DBGBVR<n>[31:2].
- Bits [1:0] of the address are `0b10`.

This means that breakpoints programmed with this BAS value do not generate Breakpoint exceptions for either of the following:
- 32-bit T32 instructions at addresses that are halfword-aligned but not word-aligned.
- 16-bit T32 instructions at addresses that are halfword-aligned but not word-aligned.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

It is CONSTRAINED UNPREDICTABLE whether a breakpoint programmed with this BAS value does not generate a Breakpoint exception on the second halfword of a 32-bit T32 or A32 instruction at a word-aligned address.

`0b1111` The breakpoint does not generate a Breakpoint exception if an instruction with an address described as follows is committed for execution:

- Bits [31:2] of the address equals DBGBVR<n>[31:2].
- Bits [1:0] of the address are `0b00`.

This means that breakpoints programmed with this BAS value do not generate Breakpoint exceptions for any of the following:

- 32-bit T32 instructions at word-aligned addresses.
- 16-bit T32 instructions at word-aligned addresses.
- A32 instructions. These are always at word-aligned addresses.

However, ARM recommends that a debugger uses this BAS value only for A32 instructions.

It is CONSTRAINED UNPREDICTABLE whether a breakpoint programmed with this BAS value does not generate a Breakpoint exception on the second halfword of a 32-bit T32 instruction starting at the halfword-aligned address ((DBGBVR<n>[31:2]:00) - 2).

It is CONSTRAINED UNPREDICTABLE whether a breakpoint programmed with this BAS value does not generate a Breakpoint exception on a 32-bit T32 instruction or a 16-bit T32 instruction at the halfword-aligned address ((DBGBVR<n>[31:2]:00) + 2).

All other BAS values are reserved. For these reserved other values, DBGBCR<n>.BAS[3,1] ignore writes and read the same values as DBGBCR<n>[2,0] respectively. This means that the smallest instruction size that a breakpoint can never generate a Breakpoint exception for is a halfword.

Figure G2-3 on page G2-5391 shows a summary of when breakpoints programmed with particular BAS values generate Breakpoint exceptions.

The figure contains four parts:

- A column showing the row number, on the left.
- An instruction set and instruction size table.
- A location of instruction figure.
- A BAS field values table, on the right.

To use the figure, read across the rows. For example:

- Row 1 shows that a breakpoint with a BAS value of `0b1100` generates Breakpoint exceptions for 16-bit T32 instructions starting at the word-aligned address held in the DBGBVR<n>.
- Row 5 shows that a breakpoint with a BAS value of `0b0011` generates Breakpoint exceptions for 32-bit T32 instructions starting at the halfword-aligned address immediately after the word aligned address held in the DBGBVR<n>.

In the figure:

Yes Means that the breakpoint does generate a Breakpoint exception.

No Means that the breakpoint does not generate a Breakpoint exception.

UNP Means that is it CONSTRAINED UNPREDICTABLE whether the breakpoint generates a Breakpoint exception. See *Other usage constraints for Address breakpoints* on page G2-5396.

a. 0 means the word-aligned address held in the DBGBVRn. The other locations are as follows:
- -2 means ((DBGBVRn[31:2]:00) - 2).
- -1 means ((DBGBVRn[31:2]:00) - 1).
- ...
- ...
- +5 means ((DBGBVRn[31:2]:00) + 5).

The solid areas show the location of the instruction.

Figure G2-3 Summary of BAS field meanings for Address Mismatch breakpoints

G2.9.5 Breakpoint context comparisons

The breakpoint type defined by DBGBCR<n>.BT determines what context comparison is required, if any. Table G2-11 shows the BT values that require a comparison, and the match required for the comparison to be successful.

Table G2-11 Breakpoint Context ID and VMID comparison tests

DBGBCR<n>.BT	Test required for successful context comparison
0b001x	• When ARMv8.1-VHE is implemented, EL2 is using AArch64, the *Effective value* of HCR_EL2.E2H is 1, and either the PE is executing at EL0 with HCR_EL2.TGE set to 1, or the PE is executing at EL2, CONTEXTIDR_EL2 must match the DBGBVR<n>. ContextID value. • Otherwise, CONTEXTIDR must match the DBGBVR<n>.ContextID value.
0b011x	CONTEXTIDR, or CONTEXTIDR_EL1, must match the DBGBVR<n>.ContextID value.
0b100x	VTTBR.VMID must match the DBGBXVR<n>.VMID value.
0b101x	CONTEXTIDR, or CONTEXTIDR_EL1, must match the DBGBVR<n>.ContextID value, and VTTBR.VMID must match the DBGBXVR<n>.VMID value.
0b110x	CONTEXTIDR_EL2 must match the DBGBXVR<n>.ContextID2 value.
0b111x	Both: • CONTEXTIDR, or CONTEXTIDR_EL1, must match the DBGBVR<n>.ContextID value. • CONTEXTIDR_EL2 must match the DBGBXVR<n>.ContextID2 value.

No context comparison is required for other valid DBGBCR<n>.BT values.

Context breakpoints do not generate Breakpoint exceptions when any of:

- The comparison uses the value of CONTEXTIDR, or CONTEXTIDR_EL1, and any of:
  - The PE is executing at EL3 using AArch64.
  - The PE is executing at EL2.
  - ARMv8.1-VHE is implemented, EL2 is using AArch64, EL2 is implemented and enabled in the current Security state, and HCR_EL2.{E2H, TGE} == {1, 1}.
- The comparison uses the value of CONTEXTIDR_EL2 and any of:
  - ARMv8.1-VHE is not implemented.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

  - EL2 is either not implemented or not enabled in the current Security state.
  - EL2 is using AArch32.

- The comparison uses the current VMID value and any of:
  - EL2 is not implemented.
  - EL2 is either not implemented or not enabled in the current Security state.
  - The PE is executing at EL2.
  - ARMv8.1-VHE is implemented, EL2 is using AArch64, EL2 is implemented and enabled in the current Security state, and HCR_EL2.{E2H, TGE} == {1, 1}.

Note

- For all Context breakpoints, DBGBCR<n>.BAS is RES1 and is ignored.
- For Linked Context breakpoints, DBGBCR<n>.{LBN, SSC, HMC, PMC} are RES0 and are ignored.

G2.9.6 Using breakpoints

This section contains the following:

- *Using an Address Mismatch breakpoint to single-step an instruction*.
- *ITD control effects on address breakpoints on the first instruction in an IT block* on page G2-5393.
- *Breakpoint usage constraints* on page G2-5394.

Using an Address Mismatch breakpoint to single-step an instruction

In execution conditions that an Address Mismatch breakpoint matches, defined by DBGBCR<n>.{LBN, SSC, PMC}, the breakpoint generates Breakpoint exceptions for all instructions committed for execution, except the instruction whose address the breakpoint is programmed with. Figure G2-4 shows an example of Address Mismatch breakpoint operation, for an Address Mismatch breakpoint programmed with address `0x1014`.

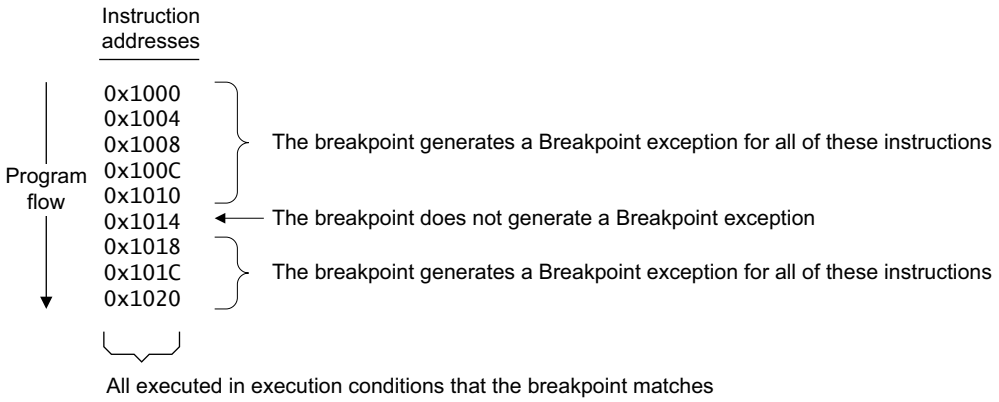

Figure G2-4 Operation of an Address Mismatch breakpoint

This means that an Address Mismatch breakpoint can be used to single-step an instruction.

In the example shown in Figure G2-4:

- If the target of a branch is an instruction other than the instruction at address `0x1014`, the breakpoint generates a Breakpoint exception when the instruction is committed for execution.
- If the target of a branch is the instruction at address `0x1014`, the PE executes the instruction at `0x1014` and the breakpoint does not generate a Breakpoint exception until the instruction at address `0x1018` is committed for execution. The instruction at address `0x1014` is therefore single-stepped.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

However, if the instruction at 0x1014 generates a synchronous exception, or if the PE takes an asynchronous exception while the instruction is being stepped, the breakpoint is evaluated again after taking the exception. This means that behavior is as follows:

— If the exception handler executes in execution conditions that the breakpoint matches, the breakpoint generates a Breakpoint exception for the exception vector, because the exception vector is not address 0x1014. This means that software execution steps into the exception.

— If the exception handler executes in execution conditions that the breakpoint does not match, the breakpoint does not generate any Breakpoint exceptions after the PE has taken the exception, until the exception handler completes and executes an exception return instruction. The effect is to step over the exception. Whether the instruction is stepped again depends on whether the target of the exception return instruction is the instruction at 0x1014 or the instruction at 0x1018.

If the instruction at 0x1014 is single-stepped and branches to itself, it is CONSTRAINED UNPREDICTABLE whether the breakpoint generates a Breakpoint exception after the PE has executed the branch.

This means that an instruction is only single-stepped if it is the target of a branch instruction and its address matches the address the breakpoint is programmed for. In the example shown in Figure G2-4 on page G2-5392, this is 0x1014.

Usually this branch instruction is an exception return instruction that changes PE mode, branching from a PE mode in which the breakpoint does not generate a Breakpoint exception. A branch instruction that does not change PE mode would itself generate a Breakpoint exception. However, it might be a branch-to-self instruction as described above.

Because Address Mismatch breakpoints can single-step instructions, the behavior of an address mismatch Breakpoint exception is similar to the behavior of an AArch64 Software Step exception.

Note

- The example shown in Figure G2-4 on page G2-5392 assumes an A32 instruction. The same behavior applies for both 32-bit and 16-bit T32 instructions.
- Software Step exceptions are the highest priority synchronous exception. Breakpoint exceptions are lower priority. See *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2179.

ITD control effects on address breakpoints on the first instruction in an IT block

In an implementation that supports the ITD control, if the value of the ITD field that applies to the current Exception level is 1, all of the following are true:

- An IT instruction can only be used to apply to one 16-bit T32 instruction.
- Only certain combinations of an IT instruction and second single 16-bit T32 instruction are permitted.
- For a permitted combination, it is IMPLEMENTATION DEFINED whether the implementation treats the combination as:
  — A pair of 16-bit instructions.
  — One 32-bit instruction.

If the implementation treats the combination as one 32-bit instruction, then as described in *Other usage constraints for Address breakpoints* on page G2-5396, an Address breakpoint might not generate a Breakpoint exception for an address match only on the second halfword of the instruction.

For this reason, if the ITD bit associated with the current Exception level is 1, ARM recommends that a debugger that wants to program a breakpoint to match on the second T32 instruction programs it to match on the IT instruction instead.

However, if returning from an exception whose preferred return address is the address of the second T32 instruction, then because the debugger is aware that the implementation has treated the combination as a pair of 16-bit instructions, the debugger is permitted to program the breakpoint to match on the second T32 instruction.

The ITD control fields are:

HSCTLR.ITD Applies to execution at EL2 when EL2 is using AArch32.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

SCTLR.ITD Applies to execution at EL0 or EL1 when EL1 is using AArch32.

SCTLR_EL1.ITD
Applies to execution at EL0 using AArch32 when EL1 is using AArch64.

An implementation that does not support the ITD control behaves as if the value of the ITD field is 0, and therefore the information in this section does not apply to such an implementation.

Note

Programming the breakpoint to match on the second T32 instruction might be necessary when using an Address Mismatch breakpoint for single stepping.

Breakpoint usage constraints

See the following sections:

- *Reserved DBGBCR<n>.BT values*.
- *Reserved DBGBCR<n>.{SSC, HMC, PMC} values* on page G2-5395.
- *Reserved DBGBCR<n>.BAS values* on page G2-5395.
- *Reserved DBGBCR<n>.LBN values* on page G2-5396.
- *Other usage constraints for Address breakpoints* on page G2-5396.
- *Other usage constraints for Context breakpoints* on page G2-5396.

Reserved DBGBCR<n>.BT values

Table G2-12 shows when particular DBGBCR<n>.BT values are reserved.

Table G2-12 Reserved BT values

BT value	Breakpoint type	Reserved
0b001x	Context ID Match	If the breakpoint is not context-aware
0b010x	Address Mismatch	If EDSCR.HDE is 1 and halting is allowed
0b011x	CONTEXTIDR_EL1 Match	If ARMv8.1-VHE is not implemented, or the breakpoint is not context-aware
0b100x	VMID Match	If EL2 is not implemented, or the breakpoint is not context-aware
0b101x	Context ID and VMID Match	
0b110x	CONTEXTIDR_EL2 Match	If ARMv8.1-VHE is not implemented, or the breakpoint is not context-aware
0b111x	Full Context ID Match	**Note** For these BT values, breakpoints are not generated if EL2 is using AArch32.

If a breakpoint is programmed with one of these reserved BT values:

- The breakpoint must behave as if it is either:
  - Disabled.
  - Programmed with a BT value that is not reserved, other than for a direct or external read of DBGBCR<n>.
- For a direct or external read of DBGBCR<n>, if the reserved BT value:
  - Has no function for any execution conditions, the value read back is UNKNOWN.
  - Has a function for execution conditions other than the current execution conditions, the value read back is the value written. This permits software to save and restore the BT value so that the breakpoint functions for the other execution conditions.

Copyright © 2013-2019 ARM Limited or its affiliates. All rights reserved.
Non-Confidential

The behavior of breakpoints with reserved BT values might change in future revisions of the architecture. For this reason, software must not rely on the behavior described here.

Reserved DBGBCR<n>.{SSC, HMC, PMC} values

Table G2-13 shows when particular combinations of DBGBCR<n>.{SSC, HMC, PMC} are reserved in stage 1 of an AArch32 translation regime.
